# Jason Sen - A 40-Year Trading Journey: From Floor to Digital Markets and Beyond

Jason Sen's 40-year trading career began in April 1987 as an options broker on the London Stock Exchange at just 19 years old. What seemed like a devastating setback when he lost his job after the October 1987 crash turned out to be an enormous stroke of luck. He was quickly hired by a market making company, switching from the limited income potential of broking to the unlimited earning potential of market making.

After three intensive years of training to become profitable, Jason was hired by a US-based market making company in the early 1990s to work as an options market maker on the London International Financial Futures Exchange (LIFFE). It was here that his trading success truly began to flourish.

The defining moment of his early career came in 1993 during the UK's extreme interest rate volatility when the pound was forced out of the European Exchange Rate Mechanism (ERM). In just four days, Jason made £1 million. While he celebrated with two Ferraris, he wisely invested the majority in property and a small business, demonstrating the financial discipline and entrepreneurial vision that would define his career.

## Building a Diversified Business Empire

Jason's success in trading became the foundation for a diverse portfolio of business ventures. In 2005, he developed a luxury property business in Phuket, Thailand, building 7 exclusive villas on a private road situated on a golf course. This property development now operates as a highly successful Airbnb business, providing him with the lifestyle and location flexibility he enjoys today.

His entrepreneurial acumen extended into the technology sector, where he has successfully invested in numerous private tech startup companies, demonstrating his ability to identify and capitalize on emerging opportunities beyond the financial markets.

In 2023, Jason co-founded an AI business solutions company with two partners based in Manila, Philippines. This venture has quickly become one of the leading businesses of its kind in Southeast Asia, showcasing his ability to stay ahead of technological trends and build successful enterprises across different industries and geographical markets.

## Mastering the Art of Trading

As the trading floors began closing in the late 1990s with the advent of digital trading, Jason successfully transitioned to screen-based options market making. However, around 2003, he made what he thought would be an easy switch to trading futures. His arrogance cost him £30,000 of his own money – another "lucky" setback that forced him to find a new edge.

This humbling experience led Jason to leave the markets for about a year to intensively study technical analysis. He then accepted a position as a derivatives broker, where he helped investment bank clients hedge their positions using his newly developed technical analysis skills. This service became so valuable that when he left his broking position, the investment banks asked him to continue providing his technical analysis independently.

This demand led to the birth of DayTradeIdeas.co.uk, where Jason began providing daily technical analysis and market updates to prestigious investment banks including Deutsche Bank, Morgan Stanley, and Merrill Lynch. His obsessive commitment to excellence meant practicing technical analysis 10 hours a day, rapidly accelerating his expertise until he achieved true mastery with his 10,000 hours.

Armed with this technical expertise, Jason returned to trading futures, forex, and commodities around 2007. However, he quickly discovered that being a technical analysis expert wasn't enough. The transition from a financed options market maker to a self-financed retail trader exposed critical weaknesses in trade management, account management, and risk management.

Even after mastering these disciplines, consistent success remained elusive until Jason discovered the missing piece: trading psychology. He realized that technical skills and risk management weren't enough without conquering the mental game that causes traders to self-sabotage through FOMO, overleveraging, overtrading, revenge trading, fear of trading, and unrealistic expectations.

A Proven Methodology Born from Experience

By 2015, Jason had developed his proven three-step methodology and began mentoring students:

Technical Analysis Mastery - His simple but effective approach refined through years of serving institutional clients
Disciplined Management Systems - Strict trade, risk, and account management protocols to minimize losses and maximize profits
Trading Psychology Excellence - In-depth psychological training to eliminate the self-destructive behaviors that plague all traders
Today, operating from his luxury villa development on a golf course in Phuket, Thailand, while traveling between Thailand and Europe, Jason embodies the lifestyle that successful trading and smart business investments can provide. As CEO of DayTradeIdeas.co.uk, he continues to provide daily technical analysis across approximately 20 markets. His Gold Membership service delivers signals via Telegram for Forex, Gold, WTI Crude, and major stock indices, while his personal mentoring programs transform struggling traders into consistent performers.

Jason's diverse business portfolio – from trading floors to luxury property development, tech investments to AI business solutions – demonstrates that his expertise extends far beyond the markets. His journey from a 19-year-old options broker through market crashes, million-pound wins, devastating losses, property development, tech investments, and ultimate mastery across multiple industries provides him with a unique perspective that can only come from 40 years of real-world business experience.

His students don't just learn trading strategies – they learn the battle-tested wisdom and entrepreneurial mindset that comes from building successful businesses across multiple sectors over four decades.

Made £1m in 4 days in 1993.

I notified my investment bank customers about the 2008 crash, which I predicted as I watched a huge head and shoulders pattern develop over several months on the S&P 500 weekly chart.

I've called many significant turning points in stock and commodity markets over the years.

I also lost a truck load during the Russian bond crisis and collapse of Long Term Capital Management!!

Made £1m in 4 days in 1993.

I notified my investment bank customers about the 2008 crash, which I predicted as I watched a huge head and shoulders pattern develop over several months on the S&P 500 weekly chart.
(I made £100k PA too)

I've called many significant turning points in stock and commodity markets over the years, including the low of the COVID correction.

I also lost a truck load during the Russian bond crisis and collapse of Long Term Capital Management!!

Made £100k in a day on several occasions, such as 9/11, Brexit and over one or 2 election day results.

Title:
Learn from the Man Who Made £1 Million in 4 Days

Subheadline:

40-Year Market Veteran Jason Sen Reveals His ‘One Trade a Day’ Method — Born from the Chaos of Global Crashes and Refined Across Four Decades.

———

✅ Section 1: The Hook

Real Money. Real Markets. Real Results.
If you’ve been burned by the gurus, this is your reset. Jason Sen made £1 million in just 4 days — not by luck, but by trading the UK’s interest rate collapse in 1993 with precision and discipline.
Now, for the first time, he’s revealing his “One Trade a Day” methodology to the public — exclusively through SmartCharts.

———

✅ Section 2: Who Is Jason Sen?

40 Years. Zero Bullsh*t.
Jason started in 1987 as an options broker — weeks before the Black Monday crash.
He’s traded through every crisis since. From Barings to Brexit, dot-com to Lehman, COVID to AI.
📍 Worked with Deutsche Bank, Morgan Stanley, Merrill Lynch
📍 Founded DayTradeIdeas, serving 20+ global markets daily
📍 Built a £1M fortune in 4 days — and a lifetime of trading mastery

———

✅ Section 3: Why “One Trade a Day”?

Because Overtrading Is the #1 Killer of Retail Traders.
Jason’s method isn’t just another strategy.
It’s a refined system of:
✅ High-Probability Technical Setups
✅ Military-Grade Risk Management
✅ Ironclad Trading Psychology

It’s not about more trades.
It’s about the right trade — once a day.

———

✅ Section 4: Free Training CTA

🎓 Free Masterclass
“One Trade a Day” — With Jason Sen
📅 Limited Spots Available
⏱️ 60 Minutes That Could Change Your Trading Forever
🎥 Live breakdown of Jason’s £1M trade logic
⚙️ Step-by-step method used by pros
🎯 Built inside the SmartCharts trading platform

———

✅ Section 5: The Lifestyle

He Doesn’t Sell the Dream. He Lives It.
Jason trades from a luxury golf villa in Phuket.
He built a portfolio of businesses across Europe and Southeast Asia.
He doesn’t need to teach.
He chooses to — because most trading education is trash.

“I teach because I’m tired of seeing good people lose money to bad advice.”
— Jason Sen

———

✅ Section 6: The System You Get

📈 Technical Mastery
- Simple charts. Powerful patterns.
- Learn Jason's top 3 daily setups

📉 Risk & Account Management
- Bulletproof trade rules. No second chances.

🧠 Psychology Fix
- Crush FOMO, revenge trading & hesitation

Integrated directly into SmartCharts — so you never trade alone again.

3. Poster designs and image prompts?

Let me know where you want to go next — or say "all at once" and I'll build the full bundle in a zip folder with visual assets + copy.

if if you don't use stop losses your losses can get out of control that can then snowball into a situation where you're Revenge trading to try to get the losses back quickly and that will pretty much guarantee you wipe out your account how long does it take to be a successful Trader to be a successful Trader can take years and actually should take years this isn't a skill that you're going to learn overnight not a skill you're going to master in six months so be prepared I've trained a lot of Traders now and the ones that succeed
are the ones that are very careful methodical they practice they build strategies that suit their Lifestyles they're not in a hurry they're happy to build a data set of a 100 trades in order to examine their strategy so if you think you're going to get rich quick overnight forget about it find something else to do the thing that you will discover as a new Trader is you will learn an awful lot about yourself and you might discover things about yourself that you don't like you'll you'll find what drives you you'll find your
emotional weaknesses it's a real journey of self-exploration and self- understanding how realistic is a 6% monthly return by day trading a 6% monthly return is actually quite realistic my strategy is to bet 1% per trade if I do three trades in a day and I have two winners those winners might return me 4% because obviously I'm hoping to risk 1% to make 2% the one trade that I lose will then I'll give back 1% so I could be up 3% in a day now that isn't going to happen every day and you will have losing days but it's not unrealistic to have a 6%
win in a week let alone a month in my five-day challenge I get my followers to focus on the psychology of trading once you have an understanding of technical analysis and you believe that you can identify lowrisk trade opportunities it's then important to learn trade management account management risk management so that you have some discipline once you've done that you're not ready to be a Trader yet you absolutely have to understand the psychology of trading you have to understand how you react you have to
understand the greed and the fear that drives you so in my five-day challenge I really do a deep dive to explain the psychology the thoughts that are going through your head the things that you need to control and some hints and tricks that I use to control my emotions to maximize my profits and minimize my losses so if you sign up for my 5-day challenge you'll receive a video every morning for 5 days and I will guide you through all the five important stages that you need to master if you want to completely control your emotions when
you're trading in the first day of your trading challenge you explain how to establish your own trading rules based on your experience in the first video of my five day challenge I will show you how to establish your own rules of trading it's really important to have a list of rules of trading some of my students create this list and they read the list of rules every morning before they actually start trading just to ensure they just keep their discipline throughout the day it's too easy as a human being to to lose control of
yourself when you're trading when there's money at stake in the second video I help traders to develop the right mindset and I explain my theory of mental Capital which basically describes your state of mind if you're feeling confident and you're adhering to your strategy then you will have strong mental capital in other words you'll feel confident you will identify a lowrisk trading opportunity and you won't hesitate to execute it because you trust yourself to do the right thing enter at the right level you're not

going to chase the trade because of fomo you're not going to miss the trade because you're worried about taking your loss you'll take the trade you'll limit the loss you'll have a good profit Target when you do this it becomes almost like an automatic reaction after you've identified a lowrisk trading opportunity and it just continues to build confidence there are two aspects of trading you need to preserve your monetary capital and you also need to preserve your mental Capital so that you have money to trade and the confidence
to build that monetary Capital sign up for my 5-day trading Challenge and get the first video of the series now

40 Years Experience, 3 Trades Daily, 60% Success: The Floor Trader's Blueprint | Jason Sen - YouTube

Transcript:
(00:00) I have learned so much from teaching people and I've been trading for 20 years and now I've been trading for nearly 40 years you have to wake up tomorrow morning feeling confident and not having dug yourself such a big hole I never thought about trade psychology for the first 20 years of my career why they screw up why they Revenge trade why they overtrade you know all the things that we know you shouldn't do when I was screen trading with my own money I mean I lost that £30,000 when I first started and that's how I learned what not to do
(00:32) [Music] hi everybody this is Bor lburg welcome to another edition of the trading battle and today all the way from the other end of the world from me I have a very very special guest a gentleman who actually probably shares a lot of the war stories that I've gone through as well but he looks about 30 years younger than I do so he must have had an easier life than I did everybody say hello to Jason sen from day trader ideas. co.
(01:00) uk Jason welcome to the show good to have you uh with us hey Boris thank you so much nice to have you around now Jason you know it's not very often that I get to talk to somebody who's actually survived the 1987 crash which was really like a foundational event for me in my life because I was all of whopping 24 years of age I don't know how old you were at that time I I worked for a very famous firm that went bankrupt called Drexel Burnham lambar which was I remember of course you know Michael milkins famous firm better better known as Drexel
(01:37) Burnham and churnam as we used to proudly call ourselves um at 55 Wall Street but um I always tell people that no event in my life I remember as clearly minute by minute moment by moment as the 87 crash which to this day still was the greatest one day decline in the history of the US Stock Market so I'm just curious is that day as Vivid in your mind as it is in mine um probably not to be honest but I mean I I do remember it clearly um I was 19 years old and I started at um Shepherds and Chase when in April of 87 I was yeah as
(02:17) I say I was 19 I had no idea what was going on I didn't even know that I would be working on the floor of the London Stock Exchange so the first day when I went down there my that was quite mind-blowing I was working as a traine broker so I was actually going into the pits I was actually taking orders off the phone uh and you know I was loving it I was 19 and it was intense um it was quite mind-blowing so I wasn't actually trading I wasn't there wasn't any money at risk at the time um but yeah certainly the memories are incredible I
(02:47) lost my job actually in the December afterwards because the volumes died and I thought that was the end of my my trading career did you start like in September was this like literally four or five you know weeks on the job how fresh were you you know when when the I April April 87 so what is that you know it's it's six months or something it was six months and prior to that it was just boom boom boom it was the booming 80s I remember you know like everybody had a BMW cocaine was everywhere and it was just you know everybody was the master

(03:15) of the universe it was uh it really was a cliche I think even mobile phones had just come out at that stage I think the big brick ones so uh well in London we were called yappies I don't know what we're dating ourselves but I just you know the audience just needs to appreciate it just how crazy that time was it really seemed like anything was possible you truly were you know Master of the Universe and at that time Wall Street and of course um the city were the center of the world at that point so um you know after the crash happened you
(03:49) know and obviously as you said things died down did you say you got laid off at that point or or uh you had to find another job Yeah by December volumes had died so having uh the bank had expanded the team so quickly they had to make cutbacks it was kind of last in first out actually it turned out to be probably the best break in my career uh because two or three months later I got picked up by a market making company so I actually got into trading as opposed to broking so oh I was pretty lucky wow wow wow wow it's funny so I mean really
(04:20) your career and my career kind of really parallel past because I used to work there was a there was a NASDAQ Market making company called herac H and gild where I spent a year on on the on the um after which my first wife threatened to divorce me because I become just Absolut the worst human being in the world having having the just the personality that was ready to you know to to to bite everybody's head off um we were the same in London same in London right I mean it was just like you you would kill the guy for a quarter at that
(04:50) point I so for the audience before electronic trading all dealing was done on the phone and almost all deal flow every stock was basically traded by a market maker who would make a bid and ask and and at that time bid and asks were done in one8 of a point one quarter of a point one half of a point um which was very lucrative because you can't like you know imagine a you know a a a $50 stock and you were able to buy on the bid and sell the offer for half a point that's like you know it it was just free money money exactly exactly when we you know
(05:36) all you had to do was turn up yeah and you know it's it's not micro pennies like it is now where everybody's you know high high frequency is cutting you out for a tenth of a tenth of a penny but at that time it was and it was all you know it was the other thing that that was fascinating about that time I'm sure you you know you probably have some stories is everything was my word is my bond you know the guy picked up the phone you know he said you know I I have 2,000 at 50 yours and you know you said it you you broke it you bought it you
(06:06) know or you know you owned it there was no way to get out of trade um right I mean uh I wonder if you've had situations where like you know you you got stuck with positions either by mistake or because you know you rookie error stuff like that I've got a good one for you um well I was on the I started on the trading floor in the on the London Stock Exchange which was where they traded stock options um so was face to face writing it on a card in a pit which was intimidating because you know it was take no prisoners uh you
(06:38) know they really gave you a hard time if you screwed up and then um uh around the early 90s I moved over to London International Financial INF Futures Futures exchange which was open outcry on steroids I mean you know it was like Chicago was a small version of Chicago and that was just incredible exciting but frightening when you first go down there and I remember the were trading the Dax and they were trading the the footsie right that was and actually it was a big controversy because you guys were the Germans really one of the DXs
(07:09) back back in um um in Frankfurt and you guys because you guys just for a while there you were just minting money because the Dax was the primary um index in Europe that everybody traded and you guys were like you really had a lot of flow on there right yeah actually the Dax wasn't traded on the on the Futures exchange that was traded uh I guess on urex I can't quite remember to be honest you you understand it better than I do because it wasn't a contract that we traded uh I I personally was a market maker in uh short-term interest rates UK
(07:39) short-term interest rates the St contracts because interest rates were swinging by like you know 2% not too bigs but 2% yeah I mean in those days also they didn't Telegraph what they were going to do they didn't keep you up to date with what the bank was thinking for some reason

they thought it was a great idea to surprise the market every time they wanted a rate move like nowadays Bank of England you know fomc they have a meeting you know exactly what time they're going to announce it you've got an idea of you know and and
(08:08) of course they only move in quarters anyway but like you said in those days it would be 1% 2% and it could be you could be having lunch on a Tuesday bang ratee move and you're like what you on the wrong side it's brutal it's a brutal move right oh yeah and I was always on the wrong side well actually you asked me about um an out trade and I the one that I really remember there was uh election in the early 90s general election I think labor were expected to beat the Tories but the Tories won I've come in in the morning
(08:38) and of course uh interest rates collapsed you know it was seen as a as a good thing for the UK um and I had an outtrade so just before the the short Sterling Market opened my clerk goes hey you got an out trade from yesterday now to if the labor had won I would have made a fortune but the T won and I was down £100,000 before the market even opened I mean you can imagine I was I was I don't know maybe 20 2 23 in this blind panic down down a six figer sum of money it wasn't fun how did that work did they give you um a certain budget to
(09:10) uh to trade I mean what what was did you have limits how did the how did the process work at that point I was quite lucky because I was picked up by a very big uh Trader from Chicago his name is Roger Carlson he had a company called First Continental trading and he was he was setting up in London I know I I was lucky enough to be one of the guys that he hired and um he had you know he had a lot of money to throw at his business so when we wanted to get involved in the position you know we could trade pretty
(09:37) big we were some of the biggest traders in my pit anyway it was primarily for Market making purposes right so you were your job was were was to basically try to keep a Even book I didn't keep an even book I I I used to have quite big positions and uh he was very good because he would swallow them and but anyway and and you would trade he was try to ride them out yeah I was I was I was quite a quite a short seller of of option SKS oh really you mean like you would sell a premium naked um on the skew yeah I would I would that was one of the and
(10:14) and I got caught out badly doing that once uh during the Russian crisis in the bond crisis in 1998 when neut rates went through the roof it didn't always it didn't always pay off you the UN longterm Capital Management right yeah they screwed me up big time but a you know I mean that time obviously clearly ahead of time how long were you in the pit for like was it um couple of years uh well I mean I was on the London Stock Exchange in in the London traded option market after my broking career when I went to Market making I stayed on that
(10:45) floor so I was learning how to make markets in individual stocks like British Airways or something like that and then when I managed to move over to the life floor I don't know maybe 91 something like that um then I was trading uh short Sterling options how long did you do that for so I did that up until about 98 99 on the floor and then I transitioned to screen trading uh screen trading options at first and and now I'm I'm mostly Forex you know that's a six seven years stint by that time you were kind of a weathered veteran at that
(11:18) point right I mean you'd seen a lot of different markets by the Millennium I yeah I had quite a lot of trading experience floor trading experience problem for most people was the transition to screen trading was a completely different skill set um for especially if you're a Futures guy for an options guy actually I found it not I found it relatively easy probably easier than the Futures guys because of course on the floor you did a trade you had to quickly work out your hedge in your in your brain you know your what's the Delta right I've done
(11:48) 500 spreads then you have you know you have to figure out your Theta your gamma all in your brain and you have to react really quickly to get your hedge off whereas when you're on the screen suddenly all the Greeks are updated for you as soon as you TR you're like wow this is amazing I don't have to use my my simple you know my my my maths anymore and you know you know exactly how many Futures you need to hedge so for me that was kind of cool for futures guys guys we just sort of were directional where was we call Delta one

(12:13) products um why was that why was it why do you think it was so difficult what was what was the skill set on the floor versus the screen firstly it was a very uh sort of uh social environment so if you got on with certain people in the pit or you looked after them you know say say you had a good relationship with JP Morgan he might be more favorable to you and make sure he traded with you most of the time because you are literally fighting for the business to get noticed it was physical um and and of course you could see the order flow
(12:43) so you're standing in the pit you know that he's he's offered in that and he's bidding that and you know you could even look outside of the pit and see who's on the phone someone's going hey what's the size in the pit and the you know the guy's signaling back to him it's 4545 you can see the order coming into the pit he might be like sell a000 at four if you were if you were quick or you happen to be looking in the right space you'd see the order come in you could effectively front run the order or piggy back almost I mean I wasn't the Futures
(13:08) guy so I I don't really know if that happened very often but basically it was it and you know it was noise that gave you a a sort of six sense as to what the market was doing um and and then and then you move on to the screen and it's literally it's just numbers in front of your face you know you lose all that all all the senses that you developed um from being in a trading pit they were useless which was a lot of Audi visual cues and facial cues all the things that sort of we as human being exactly facial cues you're right you could see maybe
(13:39) you know that was the thing you had to have a poker face if if in my pit if volatility was getting squeezed and I was short I had to I couldn't let on that you know I was suffering and I was down 20 30 40,000 pounds I had to you know you had to write out you could also see somebody who was in trouble and then you could you know you have you had all that you know killer be killed uh going for the and there was and there was proofing as well you know if I was if I was longv say for example you know or you I wanted these calls to move up I
(14:08) could be I could say I'm bid for a thousand bid for a thousand I wasn't really you know so there was that that element to it there was you know all these different elements which you just didn't then have on the screen really in fact you just reminded me that someone designed some software that created like a noise when when volumes were increasing uh you know like say trading the Bund and suddenly the order start increasing and the volatility is moving up and down there would be an audible like flaw like sound because they
(14:38) thought that would help people I think like the poker element that's I mean I remember that element so well from from both Market making on NASDAQ and then Market making options and just generally like the whole idea of the poker the the idea the market lies like I mean everybody who I think most people who are novices come to the market thinking it telling you the truth when a lot of times the the price is liy to you I mean that's the reason why people you know when you're buying novices Buy and they go how come it went
(15:07) down well because they were you know they were spoofing you my friend they were they wanted you you know they wanted you to to think it was gonna Spike or or it's going all the way down everybody all the N is always sell at the bottom how come how come it spiked out well because they were spoofy they wanted they want to trigger that level boom you know they're going to you know bring it back up on you that element of Poker I think is um very very hard to uh to learn on the screen but once you do it's actually you know it's it's kind of
(15:33) interesting do you do you find that those skills come in handy these days like on when you know when you looking at the screen or I actually it's a really good point because of my floor experience maybe I'm subconsciously more aware of that and so when I see it on my charts um then yeah that's I you know I never thought of it and you're probably right so maybe that grounding in in the floor um has helped me with that I think they call it liquidity grabs these days do they there's all this new terminology that I don't I'm like what was that
(16:04) right the kids make up names which like we all know like you know long ago it was just you know was a flush I was it was a flush man we used to flush you it was a flush or a rip you know you you lifted the whole ladder and then boom you know you you dropped it like a stone talk to my

subscribers and they come up with this terminology and I'm like uh I don't know what you mean but anyway you know for me that was a short squeeze they make up the double tops and double bottoms are like these points of interest or whatever they make up like
(16:28) it's it's just a basic double double top double bottom I know they have to make up new new terms for it and we sound like two old guys at this point yeah I'm being left behind I don't think anything new has ever been in like when it comes to trading it just repeats itself just you know under different names most of the time it's you know there's really only three things there used to be an old broker when I first first started M streo at Bear Sterns we used to love him we used to work I like when we were at
(16:55) College we used to work for him and he would say Mr Jones the Market is going to go up or down unless it stays the same and it was like to this day to this day I always remember that you know when somebody's like what do you think about the market the market is going to go up or down those the St say I'm like that's really that's it that's the only three things that they could do you know and the other one was uh what you know why why did the market go up this morning oh more buyers than sellers more buyers
(17:17) sellers that was the second that was that was his second yeah and actually uh you know I obviously I still get people my subscribers oh why did gold go up or whatever you know um and I say you can't to me that's ridiculous to pinpoint one reason and you know okay stocks will move for one reason or whatever but you know why did you know why did the pound go up when you know if there is a no news people need to find a reason and of course you know the press the financial press I don't know the Ft or something
(17:48) they'll phone up a broker and say why did the market go up and he'll come up with a reason and it's absurd to me are you telling me all the millions of participants in the market who traded in in that market that day did it all for the same reason you know it's absurd very often I mean what you didn't want to hear this because I I I've been on a thousand uh ends of that conversation with with the media you know because I used to do a lot more media than I do these days but like you know and they always just want to reason but what
(18:13) people don't understand is a lot of times the reason is really random some guy some guy had a massive order he flooded the market and the market dropped like you know 10 points and there was no news there was no you know and you know he just flooded it and then everybody said oh you know we're going down let's join the party and all of a sudden you know we started at 10 now he minus 20 um and it happens I remember there was there's this really funny book um this guy who was a money manager wrote a book he talked about the fact
(18:47) that they were like on the New York Stock Exchange they got really drunk at lunch and one of the guys he this a huge huge money manager just decided to start buying this one stock right and the and the uh uh the market maker the the the specialist this is when New York Stock change has specialist was like you know he was only good for a couple of thousand and the guy just keeps coming back at him keeps coming back at him so started like the stock started running like 10% it was you know and all a sudden every in the media like oh my God
(19:12) you know this this this this event in this stock and you know what's going on and everything else and the guy was just drunk and he just he was betting another guy to see how hard they can get the stock up by the end of the day was up like 20% and there was all the speculation wow just all nonsense it was all nonsense just classic story just shows how how ridiculous whole system can be I mean it's always supply and demand that's really what it is um that's why you don't want to overthink it too much so um you know when the Arts
(19:38) came around and you moved to electronic trading this was all still on the institutional side right you were working were you working for banks and Brokers that point uh I never worked for a bank I I only I traded for I mean this guy Roger was uh an individual he he had his own company uh but you know he he was self- financed after the floor shot I continued to work with him on the screens I was trading the MIB options the Italian MIB options which was completely different to short Sterling um and then eventually I got I decided I

(20:08) wanted to move out of options because Market making options you you always have a position you're never flat so you know you can be on holiday and you find yourself most of the day on the on the phone you know hey what's happened have we moved what's my Deltas always moves right like the option position the thing it's not static like you know every because it's a derivative and and even tiny move in in the underlying is going to really skew the book one way or the other constantly con your Greeks change even
(20:35) if you haven't traded your Greeks change you know your gamma's changed your Delta's Chang your theas your your Vegas you know volatility can move volatility like exactly just just like volatility itself which is nothing like nothing could like price could stay stationary but volatility Changes Everything Changes in the book exactly so you're constantly monitoring your position and I thought you know what I've done this for 15 years I want to I I thought I would try to trade Futures and I thought I could trade fut futes if I can trade
(21:00) three months you know 15 strikes in each month run a book like this how hard can it be to trade the Bund you know it e it's either going to go up or down and uh I guess I arrogantly thought that I I would be able to be a good futur Trader and I very very quickly I think I dropped about 30,000 PS in two or three months and realized I have absolutely no idea what I'm doing here so um I quit and that's actually how I got into technical analysis because I thought I going to have to I'm going to have to find an edge somehow I want to go back
(21:29) to options trading so that's I studed technical analysis and and now basically and I have a business based on that now were you still working for Roger at that point or when you said I'm want to trade the bond I'm gonna pull my it's gonna be my own money I'm gonna try to trade my own positions no I I yeah I went off on my own with my own money put up 30 grand um you know in a prop house you know uh so we'd actually go and and stick our money in and we go to the office every day so you could still mingle with
(21:57) Traders uh yeah and I that mry real quick and I realized I have no idea what I'm doing so I I thought yeah the only way I can find an edge is to learn technical analysis um and I ended up like when you said I don't know what I'm doing you know you probably obviously had a little bit of capital safe so it wasn't like you know you had to make money instantaneously but how did you what was the process like how did you pull yourself like the moment you you started you said okay this this is out of control I got to stop what did you do actually I went
(22:26) traveling I thought if I keep going I'm going to blow more money I might as well spend it on traveling so I'd never done I'd never gone traveling because IID started working from the age of 19 straight out of college uh so I did that I read a load of books I started educating myself actually when I got back um a guy a friend of mine said hey why didn't you come back come and try option broking drived broking so I said yeah sure I'll give it a shot while I was studying technical analysis and what happened was I started saying to the
(22:54) clients hey you know there's some resistance here and there's some support here and the clients were like hey this is really good technical analysis wasn't a really big thing back then uh people were aware of it but people didn't really use it and suddenly I was picking out levels which were working and they were like hey you know and this is like Deutsche Bank Morgan Stanley Merill Lynch so big Banks um and then when I left that broking I decided I didn't want to go be a broker anymore I wanted to go back to trading they said hey look
(23:20) could you continue the service and that's how my um my uh signal service was born really about 15 years ago so it was basically time was it was basically a newsletter kind of a thing right or where it was like Yeah well yeah that's right I would send out email out a newsletter each morning yeah where you would deconstruct various um support resistance levels for um exactly for and then which instruments were you were you uh analyzing go that's a good question um I think it was mostly burn bubble um uh what else would it have been yeah
(23:56) some f it was futures mostly Futures fixed income yeah fixed income so I mean you spent a lot of your your trading life on the fixed income side right um did yeah but then then it sounds like you moved into Forex what when was the transition and like what do you do now it was difficult to

maintain my uh signals business with the banks because eventually they would start to cancel and it was more and more difficult to contact the banks and offer them the service so I transitioned into offering it toward to retail Traders and
(24:33) for that reason you know retail Traders weren't really trading Futures so I started to look at Forex um and that was great because Forex trades 24 hours five days a week um so so the quality of the data for technical analysis was good and yeah and I and I fell into that and uh it's also like a very very close to fixed I mean Forex is basically I call them you know intraday bonds because Forex is kind of a you know a very close cousin of fixed income because all Forex has a role and currencies are like Ultra
(25:03) short-term bonds if you think about it they're very very interest rate sensitive so if you understand if you understand interest rate markets you can really it's it's a natural transition to move to Forex that's actually a really good point as well something I had thought about so maybe my um my stirs background has helped me with that too yeah good point so you moved um what what year was that that you started sort of getting interested in Forex was it like mid mid Arts probably about 15 years ago right so like 205 206 let me see now hang on I
(25:37) was doing I actually was doing a lot of stock markets because the global financial crisis now that was 2008 it was that were you doing it before the GFC so I was I I was definitely covering stock markets at the time I would have been covering the US oh and I was doing the Dax as well you talked about the Dax earlier so I was doing uh fixed income and stock indust because I remember seeing a big head and shoulders pattern forming on the S&P in 2007 and saying to Deutsche Bank I don't know I don't understand this but there
(26:08) is a big negative pattern building and if it breaks this level there there is a chance that the market could plunge what could trigger that and they were like uh we don't know there's nothing that we can see on the horizon that would trigger that and of course in the end it played out it was it's plain for anyone to see anyone who understands The Head and Shoulders pattern can go back to 2007 and they'll see it on the S&P but it was a great prediction yeah it was a good good car that was a good car and then but Forex was a little bit after
(26:32) that after GFC you started you started looking at it yeah I think it probably was maybe around to around 2010 about 15 years ago got 15 years ago that's 2010 I can't believe it but now time really flies and these like these days what's the primary instrument focus is it is it FX forx and gold I also cover silver oil and I do still do the US Stock indices so I so I cover whatever I mean I don't cover specific Forex markets I try to look at all the majors to try and find Opportunities rather than focus on say
(27:05) three uh currency pairs uh and and I find it difficult at the moment because most currency markets are not in very clear Trends the Dollar's been trading mostly sideways for years the Yen uh did have a good run up but in recent months it collapse and then a run up but in recent months has been trading sideways I'm I'm primarily a trend follower so I I struggle with sideways markets so when you moved over to to technical analysis it sounds like you sort of did your perspective expand like I mean you know when you're Market making you're just
(27:37) you know you're day trading all day long what are your positions like now how do you generally provide signals or or commentary or analysis on well yeah I had to develop a strategy which I never really had before as a as a derivatives Market maker you know you don't have a strategy and the other thing actually which was fascinating is I never thought about trade psychology for the first 20 years of my career and then when you start trading Futures and and Forex you suddenly have to you suddenly realize all the things that going in your head
(28:05) and how you screw things up that that wasn't particularly a factor when you're just Market making so that was a real interesting journey in into trade psychology and understanding how to build a strategy an entry strategy a trade management strategy account management strategy an exit strategy for the for whatever trade you have on as well uh you know all of these things were were completely almost new to me uh and I'd been trading for 20 years mean now I've been trading for nearly 40 years so for the for the second half of

(28:37) my career you know I had to almost relearn you know learn a whole new skill set so what what did you learn in that second half of the career as far as trade man like what are the best behavior practices that you think you've distilled out of that second half of the career in terms of trade management uh portfol management account management what are some of the ideas you think uh really really are important the first thing is to actually have a strategy so many retail traders that I meet that are starting out they think you know the the
(29:09) idea the way you make money is by guessing Direction every day and uh I don't think anyone on the planet can do that consistently I certainly can't so I'm a support and resistance Trader as you said earlier I'm a trend follower um I find that easier to do um I I I guess if I was going to give one tip I would say control your size it's so easy to trade bigger size than you're comfortable with and you may not even notice that you're doing it and I and the one thing I probably the key point that I make is if you're in a trade and
(29:42) you're feeling uncomfortable about it if you're constantly looking at the trade if you're worried if you're anxious it's usually because your size is too big it's not that you're worried that you're going to lose because if you're a Trader you know you're going to have losing trades it's it's because you're worried about the actual size of the loss that's what you're stressing out about and of course that has has another repercussion because if the trade starts to move in in the right direction and it becomes
(30:10) profitable you're also the anxiety starts kicking in early because you're like wow this is a big sum of money maybe bigger than you're you're comfortable with and you're like suddenly you want to take the profit and you and you'll probably end up getting out too quickly I never thought of that but that is a really really good point that larger size actually the moment you're tick up you're like I want to take profit uh because lar larger size makes you think oh my God I'm you have that that fear of and then you're not
(30:39) you're not learning to to run a trade which is something which is not a very important skill you know we know cut your losses and run and run your profits and you're not allowing yourself to learn that if you if you're trading outside of your comfort zone is there particular um percent that you recommend for Traders as like what do you think is a good size trade 2% 3% 1% is there a number that you work with that you think is is reasonable I I I teach 1% because when you when you're starting out um you've got to be able to sustain a loss
(31:13) of 6 78 losses and not be in a situation where you're where you're then frightened to trade if you're down six seven 8% you can sleep you can wake up the next morning you can start again if you're down 25% you're you're in a big hole it's going to you know you're going to really struggle to make make that back in fact um now with prop firms and the prop Trader challenges that we have seen grow over the last few years I have most of my subscribers you know are on these challenges and I say just trade 0.5% there is no now most of the CH
(31:44) these challenges don't have a time limit so you you have to get to 10% eventually why hurry if it takes you three months it doesn't matter and throughout that three months you're learning so it's it's a learning experience as well you don't have to rush to get to that to that 10% Target just take it slow um instill good habits um you know learn the process make it become automatic um yeah that as we know it's it's the process it's not the profits it really is yes I I I couldn't agree more but it's it's a lesson that we all have
(32:15) to learn and over and over and over again and we learn by by losing and making mistakes don't we that's the problem the lessons are expensive speaking of that by the way I'm just curious you know we all have horrible War Stories but like maybe give me one a couple of your and not necessarily on the floor because we all know on the floor you know you can blow up 100,000 in in the morning it' be up 100,000 in the afternoon because it was just it was just that kind of a place but like when you were doing an individual when you were learn
(32:44) relearning in the second half of your career which is much more what the retail experience is like what was sort of like the worst experience you like what was the worst trade that happened to you where you just got caught and maybe you you know you you kept going after it or you just

you didn't want to lift it off do you have like a nightmare story uh I don't have any particular nightmare story that I can think of for when I was screen trading with my own money I mean I lost that £30,000 when I first started
(33:14) I did lose money I remember shorting the stock market many times thinking this is overdone uh trading against the trend not putting a stop loss order in maybe even adding to the short position as it went against me doing everything wrong and that's how I learned what not to do through screwing up and not yeah not using a stop loss whatever um because also in those days there weren't that many books I mean you know YouTube videos didn't exist where you could learn from experienced Traders and also how many experienced retail Traders were
(33:47) there that you know when when I was working on the financial Futures exchange it was only open about six or seven years so it's not like you had Traders Decades of Traders who are writing books about trading derivatives it didn't exist you know you learned by being thrown in the pit and and figuring it out and if you didn't figure it out you lost money and you were gone and of course probably well anyway a very large percentage of Traders just didn't make it like some like 80% 90% right it was probably down the road still the case
(34:18) now I believe yeah is there any particular technical instruments or technical indicators that you like or are you primarily a pattern Trader like what do you what is your strength and technical analysis I I keep it pretty simple I did what most people do when they start technical analysis you throw every indicator on the chart you know every tool and then you weed it all out and realize what does and doesn't work and because I cover so many markets mainly for my subscribers I don't personally trade that many markets but
(34:47) you know I could be looking at 30 pairs gold silver oil uh S&P NASDAQ Dow Jones I have to have some kind of one-sized fits-all um technique for my analysis so I I use trend lines moving averages Fibonacci candle formations candle patterns that's pretty much and I look at four different time frames it's it's pretty simple what what time frames do you look at 1 Hour 4 Hour daily and I keep an eye on the weekly you have to you you got to be aware if the Market's been in a bull trend for three or four months you might just be a be about to
(35:19) hit a 15-year Trend you know downtrend line you got to be aware of that so um I do advise people to look at longer term charts occasionally you try to look for Confluence on all those or do you look at yes exactly I look for Confluence 4H hour chart is usually my go-to chart although I must admit recently in recent months with with the lack of Direction I'm probably more focused on the one hour chart just trying to find a trend a short-term Trend that I can risk 25 Pips try and make you know 40 50 60 Pips are
(35:50) you primarily a retrace Trader when you when you talk about support resistance let's say your classic setup you know you have a long-term trend on The Daily this you know four four looks relatively healthy and we're just looking for a um for a dip on the one hour um that you is that the idea exactly yeah I you know very basic I buy at support in a bull Trend I buy it on a break above resistance or a previous high in a bull Trend very very straightforward there are two you know schools of thought of you know support resistance buying
(36:22) selling which is one is like you just you know you assume that support you make bid because because you don't get a second chance at at the Apple meaning you know it's going to drop it's going to be very very fast and it'll come back up the other school of thought is no you know if this is support um we look for it to test and then we look for it to to bounce back up and we're going to join the move back up we we need it needs to prove to me that it's actually going to reestablish the trend up yeah confirmation confirmation which of the
(36:51) two schools of analysis do you subscribe to more I am the the the the first one for two reasons I've missed trades by waiting for confirmation and I'm basically lazy I don't want to sit in front of a screen all day watching for confirmation I'd rather just I put a a resting order in there or you know a limit order um I I I trust my analysis I mean I should do I've been doing it 20 years uh so I I'll put the order in and I have my stop-loss I have my Target and I just walk away and I don't believe in trade watching

(37:24) for me personally it doesn't work I will screw it up I believe in uh plan your trade trade your plan and in order to trade my plan I need to not be in front of the screen because because that's when the emotions kick in and that's when you start second guessing the market and it's futile it's really it's really silly if if if if I if my analysis is any good if my strategy works then by the by the time I enter the trade I shouldn't I really shouldn't touch it and then so you're in let's imagine you're you got you got um filled
(37:52) on a trade what's the next process do you um you come back to the next like when do you check on it or is there just simply it's a it's a simple I'm buying here I'm exiting here it's a single you know it's one entry one exit or is there management process what happens um next yeah I mean I will Trail my stops I will keep an eye on the trade um I don't believe in trailing your stop too aggressively because too many times of course you know we've seen it Market comes back down retests and goes some people like to move their stop loss to
(38:25) break even as quickly as possible because they see it as a free trade fine fair enough if that works for you it doesn't work for me why would I risk exiting a position at the price at which I thought it was a great entry doesn't make sense so I I will I won't I will tra my stock but it won't be aggressive and I also believe in partial exits so I will scale out I will scale in as well actually over a small range but I will scale out so I will set myself two or three targets and exit the position as we hit each because earlier we were
(38:55) talking about the anxiety that kicks in when a trade moves into profit um when when that initial it happens initially you're like okay this is actually a sum of money which I don't want to lose I worked hard to get this trade you know I don't want to see that money evaporate that's where I think you should take a partial profit I don't know 25% 30% of the trade off it relieves that anxiety you can say okay I'm in a win-win now if the market pulls back to the entry point I might even jump back in again on that
(39:23) portion of the trade but if it keeps going I'm fine because I still have a position on so I so mentally it's a win-win so you give up 25% but it's not like you move everything to break even you're still at the stop at that point you give up I I would probably Trail the stop halfway to break even as well so I've taken a partial profit I've reduced my risk but but for for me it's all about my state of mind how do I feel about this okay I I feel comfortable because if the market retraces to my entry point I can buy that 25 30% of the
(39:54) position back in maybe um but if it keeps going yeah I'm going to still win have you ever been able to recycle The Profit like in other words you take a third get come back in and then it goes it resumes the trend and you're able to recycle Prof it yeah I've done that as as as you know markets retest levels um so what you don't want to be doing is getting out when it retests the level in my opinion you you want to if anything be adding you know be jumping back if if you can jump back in having taken a partial profit uh it's all about state
(40:24) of mind isn't it it's about feeling confident and comfortable the single most most important aspect of your system is that you really trust your levels it sounds like like you know that's the first step is if you really think those levels are good whatever percent of the time and by the way if you I I I I I percentages are we all know they're garbage because they all they change from day to day but generally like um what is your confidence level on uh on On Any Given trade do you think that you know I have like 50% confidence level 40% confidence
(41:00) level when are you I think around 60% of my trades work it's a very bupar number I wouldn't I wouldn't say I I give a confidence level to each trade uh what I used to do is oh I think this trade's probably better than that one I'll do that trade because I still think it'll work but I think that one's really going to work so I'll bet more on that one than that one and it just didn't work I'm constantly surprised at which trades do and don't work even to this day and that's after nearly 40 Years of trading so I just do the same size on every
(41:32) trade because you know you you don't want to if if you if you have one trade that loses and You' bet twice as much then then you've got to work so much harder to get just to get that money back and it just doesn't work for me I'm kind of I'm there with you I like I like uniform entries um on

the positions that's interesting so basically what Ian I guess I what I meant by confidence level is that you have a generally strong belief that 50% of the time at least these levels will hold and you're going to be you you you'll have at least
(42:08) a you know you'll have at least a partial and in the best case scenario a full exit structure and and what what type of risk reward it sounds like you you sit up sometimes almost two and a half to one I mean sounds like you said yeah I I'll bet 25 try to make F1 would be a normal yeah uh pretty out you know we all know that that the El Dorado is is if you can do 50% at two to one it's like printing money then all you got to do is take every trade exactly you know like I mean it sounds so easy and everybody like oh you know
(42:39) like you can't imagine how difficult that is to actually achieve in real life it's not easy if it was easy I'd be a billionaire exactly exactly we all we all be takeing us you know it just it just markets don't roll that way uh with you but that's generally that's the guidelines that you work with right and of course Sometimes some of those will be shorter like the exit maybe like only one and a half because you know yeah you yeah it depends on the chart depends on the chart it depends what it's doing right now what's the duration of your
(43:07) trade these days is it hours days uh what's the average duration it's certainly hours because most of my trades are based on the 4our chart um I would say quite a few I couldn't really give you a percentage but quite a few have to be run overnight in order to achieve the Target and that's purely because Forex markets just don't move that much anymore you're in Asia yeah yeah well you know I remember the days when the Euro US dollar would move a 100 Pips a day guaranteed I almost I almost hate talking about that because it
(43:39) really makes us sound super old but yeah I remember I remember those days really well you know I remember when you know pound Yen would do like 300 300 Pips every day and it was just you know was it was a great yeah yeah exactly so now because of that if you want if you want to squeeze 50 60 Pips out of a trade you have to usually run it overnight what is speaking of that what is your average day like you know you're in the East you're you're in Thailand so you're sort of you know you're in the Asia session
(44:05) how does your day go uh from a trading perspective I'm a person that's always got up pretty early so I don't have to set an alarm which is quite nice when I wake up I'm on the phone pretty much straight away in bed looking at the markets um has everything happened as I expected or are there any surprises I'm down cup of tea screens are on and then I spend about an hour or two straight away really um getting into my analysis and I write my reports for my subscribers I have like a trade sheet colorcoded trade sheet with my where I cherry pick what I
(44:36) think are the best opportunities for the day so that my subscribers can put limit orders into their books and then go off to their job or you know whatever they're doing running running their businesses um I call it like a set and forget strategy where you can just you know you do the work in the morning and then you're done you wait and see what gets executed you already know your stop loss you already know your target um so so for the rest of the day I'm not really focused on the markets to be honest I'm you know I'm 56 I've I've
(45:03) been doing this for nearly 40 years I don't want to be stuck in front of a screen all day luckily I'm don't need the money anymore so for me my priority is more time money do you live on the beach or do you do you live like somewhere where it's uh I live on a golf course which is s kilometers from the beach so I I want to have an outdoor life I'm trying to remain as fit as possible as I age and I want to my daughter's 16 I want you know and we spend quite a lot of time together that's precious to me uh so yeah family
(45:33) time and health and fitness is is more important to me than money now and I and I have uh a few other businesses which I have to keep an eye on as well so how many positions on any given day do you think would get triggered and you have to run them H I'd say three to four would be an average day which is enough yeah no it's that's a lot I mean that that's pretty active I mean you do that you do that five days a week it's it's it's it's an active enough uh it's an active enough book to uh to make it uni being in Asia is quite good because I I

(46:01) don't have to rush through my analysis if I finish it at like 9:00 then in the UK it's 3 2 or three: in the morning I have some us clients as well they can put their orders in before they go to sleep uh and then as you say maybe six or 7 PM in Thailand which is midday in the UK I'll I'll have another look before I you know do you check it on your phone or do you um uh do you go to your computer yeah I'll go to my my laptop I've got a plug-in screen so I've got two screens which is an easy setup I travel quite a lot I really like to
(46:31) travel so that's great I can just Chuck it in my backpack and uh I can open the screens up if I'm in a lounge an airport lounge or whatever a cafe and have a quick look would would you travel mely in Asia or do you travel all across the world I used to travel quite a bit in Asia I tend to go back to Europe a bit more now because U my son who's 19 is over there trying to um be come a professional footballer so I I like to fly back and see him and family and and most of my friends are in Europe so like to go back now that I have more free
(46:59) time and when you're in Europe and you're sort of a European time do you adjust your um you still wake up early and you kind of just sort of AJ I really suffer from the jet lag I'm up at 3: or 4 in the morning and I could be there for a month and I'm still waking up at three or four in the morning it's really frustrating well having worked the London shift for the last 25 years out of New York I don't suffer from I don't suffer from Jed L anywhere I go in the world because I basically don't sleep anymore so you're already on that time
(47:25) zone yeah I'm already I'm already used all of that so as so um amongst the markets that you know that you kind of just trade you said a lot of it as FS but I'm curious you know I need your I'd love to hear your opinion through the key the big markets NASDAQ how's it looking to you these days um actually I'm on the lookout for a reversal pattern now that hasn't happened at the moment but we could be we're in a consolidation for the last few months there's no question of that um so it obviously it can break either way up or down I'm
(47:59) looking for signs that it might move to the downside I don't have them yet I've got a gut feeling that we're in for a correction but there's no confirmation that yet what would make you feel like we we made a pretty serious top and and and and the trade is to the downside would it be a break of the 20,000 would it be 21,000 any levels I'd have to have a quick look at my chart actually I don't have the levels in my head sorry about that um I I I can see the pattern in my head but I can't remember the exact levels um and as I say you know a
(48:29) consolidation pattern is is obviously usually you have a pause and then the market continues in in in the longer term Trend and that's definitely bullish so right now I can't say that the market is going to reverse I have this gut feeling and I have I'm looking I'm looking out for signs of it but there are but they aren't there yet but like you say we're going to have to break a certain support level um within that consolidation pattern that would trigger it with a if if if we're lucky we get the break we get the retest of the break
(48:58) point and then the market goes that would be just a a really nice easy textbook entry point do you do you look at the Nik at all I haven't looked at it for ages no okay what about talk about that with Nick last you said you were chatting to Nick we I should have asked about the N know because because I feel like Nik is actually the opposite it's you know it's it's Gathering Steam for for you know after 30 years ready ready to finally just go maybe to really okay I must have a look at it yeah I've been looking at
(49:31) Bitcoin as well actually that's that's great what do you what do you think of Bitcoin uh at this point well I'm I'm also wondering if we're having some sort of similar pattern recently I can't remember it was we broke above the previous all-time high but we came back real fast um and I could almost describe it as a potential double top I'm probably going to get death threats for this talking about potential move to the down in Bitcoin again it's not there we would definitely have to break 91,000 or even 990,000 for it to trigger if that
(50:04) happens we could get to 75 70,000 but before anyone starts sending me hate mail that that we're we're we're we're way off that at the moment I think we're trading at 97,000 so I mean having having been a Bitcoin skeptic for so many years and I kind of maybe maybe this is the problem that

this probably going to be the top is because I finally become a Believer um the one thing you have to say about it is every draw down is to a higher low like I mean just secularly it is a it's still I mean there's nothing technically they could
(50:36) deny a 500,000 you know print sometime down the road maybe five six years down the road you know because it really is you know has maintained its bid um against all I thought it was just you know I felt stupid because I I didn't I didn't see it as an investment but I forgot the fact that it you know we we can have fads where people everyone wants to jump in and this one's lasted longer than I thought but yeah we're in a very wellestablished bull Trend and I am a trend follower so sure why why don't we go to half a
(51:08) million I I I can't say that that won't happen and then of course ultimately the trade that I think everybody's really involved in one way or the other is gold at this point what what is it looking like to you yeah gold is probably my favorite Market my calls in Gold are really good and I mean partly because it is in a bull Trend it's not that hard to trade um you just buy it you know you buy it at support you buy it when it breaks resistance you buy it when it breaks above the all-time high in recent days we keep having new all-time highs I
(51:36) think I saw this morning it's got to what is it now 28 20 something 294 we're really we're really CH like we're choing at the bits for the 3,000 level which is really exactly exactly that's where everybody is just certainly F and you know as as ex market makers we all know that there's a ton of stop orders over there there's you know there just there's a lot of there's a lot of optionality over there because I'm sure there's probably barer options over there so people are just chomping at the bits to blow to
(52:05) blow through that level um it's gonna be really probably flush at 100 points before you know after it comes down um by the way speaking of of all those I mean these are all tricks of the trade that you know you and I both know how do do you uh sort of anticipates like when it comes when it comes to all-time highs on insulant do you have any particular techniques that you like to um employ as far as trading um I just buy on a break above an all-time high I will buy if we come down and retest a previous all-time
(52:40) high if it ties in with things like trend lines and moving averages and my Fibonacci levels um pretty simple stuff I Gold's getting very overbought and as we approached 30 3,000 it's such a big psychological number yesterday for example I was on a little bit of an alert for a new alltime high and then a big pullback I'm you know I'm on the alert for like a shooting star candle or a bearish engulfing candle something that tells me that there is a bit of exhaustion and I I thought we might get that at the beginning of this week and
(53:11) I'm and I'm wrong yesterday we just pushed higher and pushed higher so I don't try and anticipate I don't have any expectations I wouldn't gamble I I will wait for the for for a signal so ass soon we get a shooting start or or you know we get some kind of some kind of a signal that confirms you said you're primarily a trend Trader but you will tactically go counter trend is that is well what when you were looking at or you are you looking are you looking just simply to let it come down to support because ultimately you want to be on the
(53:37) long side of gold you just you're just looking to buy it cheap on on a single candle I wouldn't I would never get into a short position even if it was a bearish engulfing candle I wouldn't I would I would my first assumption would be that okay we've seen a negative candle that is a bit of a bull trap that doesn't signal to me that the Market's about to completely tra change Trend and collapse it probably signals that we're in for a period of consolidation because that's what normally happens in a bull Trend you hit consolidation first
(54:04) markets very rarely just goop and then vop unless there's been a specific trigger so I will be on the alert for okay probably consolidation I will still be buying in a consolidation I will still buy at support levels uh you know we it's still at the lowest risk way to trade a bullish consolidation I won't be really looking to get into short positions unless we've got a very well established Channel and the upper trend line has been tested two or three times then I might say okay well you know what it's worth having a little punt with a

(54:34) tight stop and I might be able to scout this level that's really interesting point and I and I haven't thought about it a lot but I think it's such such an underutilized profit idea which is that in a bullish Trend buying at the consolidation at the low of the consolid this consolation support is one of the least riskiest one of the most easiest profit trades there is because you already you know have all that momentum you're able to basically buy cheap and it's even if it goes halfway range you're still going to make tons of money
(55:04) yeah you know the buyers are coming back in eventually and I and I don't even mind if it breaks that level and I get stopped because I know that it's going to come down to the next support level and that's probably going to be an even better buying opportunity anyway the bounce is probably going to be stronger especially the first time it tests that support level so you know hey I don't mind okay I've lost on that trade a better opportunity is probably coming anyway so um what are you doing these days Jason I mean you you obviously have
(55:28) the uh the service is there anything any new projects that you're starting um for retail Traders I've really been getting into the education side of things that as I spoke to you earlier about the whole trade psychology I have really found that fascinating and over the last five years as I've uh teaching Traders I've really got into the psychology side of things I've been really been breaking down people's thought processes with them I have learned so much from teaching people um and understanding what makes them tick and why they screw
(55:56) up why Revenge trade why they overtrade you know all the things that we know you shouldn't do and I I've actually been working with one guy specifically lately that's taught me so much when he came to me three or four months ago he had a really great strategy it's based on the woff system which I'm actually only learning about now and that that's fascinating so it's been very educational for me too and he was all over the place he would have a great run he would do really well he can pick trades that you risk one one and you
(56:23) make seven eight nine I'm like wow I my strategy doesn't do that generally this is incredible and he's trading off like a five minute chart so but he just kept screwing up he just kept he'll do well and blow it blow it blow it blow it and I and I worked on his trade psychology and now every pretty much every day he just makes money and that is such a massive sense of achievement for me to have turned it around what was the key tweak with him what was he what was he doing wrong that you fixed it was quite a lot but if I had to put my finger on
(56:56) one key thing he would overtrade when the trade went wrong he'd then he'd lose control of himself he'd get angry he would Revenge trade and he would lose all his discipline so one of the things I said to him was right we need to limit how many trades you do per day so that you really cherry-pick what you do so I said to him right we're gonna have a rule you only do three trades a day and and that along with several other um ideas has really worked for him they forced him they forced him to choose and also force them to walk away and and not
(57:28) not exactly yeah exactly because there's always another day there's always another day yeah and that's actually a really good point there's always another day you have to wake up tomorrow morning feeling confident and not having dug yourself such a big hole that you you you're you're frightened you're in the wrong state of mind it's it's so important to wake up the next day feeling confident and and actually I just want to say one more thing we talk I talked earlier about how you got to control your trade size um and and partly you've
(57:55) got to do that because you because confidence is obviously so important you need to wake up the next day ready to trade not frightened to trade because you can't afford to lose more money and you will you will know you you said do I do I risk two 3% you can do that but you can't do that until you really trust yourself you know that you will make the right decisions when you're in a trade and we all get to that point eventually that's when you can start to scale when you when you think right when I get into a position I will not screw it up I will
(58:28) do what my strategy you know for says I should do it's having faith in your strategy which is ironic enough like you know we always talk about you have to reason but ultimately I always find that it's actually having faith in your strategy which is based upon reason but it's but but it's

also having faith in yourself to execute that strategy without screwing up without getting fomo and revenge trading and overtrading and running positions too long or not cut you know yeah I guess that that's what I mean because having faith in your strategy
(59:00) means that you don't deviate from it you actually accept it um and then um accepting the fact that it's going to be wrong quite a lot like in other words not you know not once you lose you go back to the strategy you don't try to change the strategy that's true that's a really good point that's a really good point you have to basically you have to have let's say at least 100 trades of your strategy to to be able to know whether the stry works and then when you have let's say the 100 trades you can then actually optimize it okay how can I
(59:33) improve the strategy what do I need to tweak do I need to make my stops tighter or less tight do I need to take profit sooner or later you know do I do I need to maybe wait for confirmation like you said earlier instead of jumping you know instead of having limit orders I don't know there are ways you know you you can't do that until you have a data set to actually play with in my experience certainly for me but also a lot of traders in my room I think that's the key thing is that most Traders can't Envision a hundred
(1:00:00) trades of the strategy they're just thinking about the next trade all they're focused on is I need I want to make money on this trade whereas instead of thinking this is just one out of a hundred that I'll be doing in order to see you know where I stand um at the end of a couple of months it's the that's the ability to just kind of take yourself out and realize whatever trade is happening however bad it is whether you screwed up whether the market is really screwing your or you just got stop the big plan right that's actually
(1:00:31) a really good point brings me on to something else that I I've was working on with this guy I talked about a few minutes ago he said I don't know he let's say he's got 10 grand in his account he he said I want to I want to grow that to 30 grand over the next three or four months I said okay that's super ambitious but with your strategy that's actually possible because your risk reward works so well um but the thing is in his mind okay I want to get I want to grow it to 30 grand you know in three or four months but the problem
(1:01:00) is what he was really doing was trying to grow that money to 30 grand immediately and like you just said you've got to take it a step at a time so I said look try to get to 15 first this month if you could make 50% profit in a month that is phenomenal but with your strategy it is doable forget about the 30 you're trying to get to 30 in two weeks you know you're not trying to get to 30 in three months you're saying that but you're not doing that you're overtrading so it's managing expectations my partner who trades Forex one of the most
(1:01:34) disciplined people I know she's amazing um and her rule is she just tries to make a 100 Pips a week that's it like no more no I mean you know occasionally Shel she have some weeks where there 200 Pips and other weeks where she'll be negative but the very very fact that every week starts fresh and it's just that 100 pip Target that is amaz amazing because she's you know over the last five years it's been really like about I think five to 6,000 Pips in total uh pel because she's just so you know focused on this on one step at a time she
(1:02:08) doesn't thinking about I'm gonna make 5,000 Pips you know in a year she's thinking I'm gonna make a 100 Pips this week that's all I'm gonna do and that keeps her very yeah the other thing is she doesn't have the male ego we need to be right it's not just about making money we need to be proved that we are right and the M ego gets in the way a quote that totally changed my whole life and it was the guy said you do not want to be right you want to be in the right mindset winning is not about being right it's about
(1:02:42) being in the right mindset and that was really really altering for me because I realized it's it's about having the control the mindset um it was a book on negotiation but it was literally one of the most probably most useful book about trading I ever read Because when you think about it the market is just basically a negotiating partner with you all the time and it does all these you know all these psychological tricks on you all the time so it's you know it's fascinating I I find a lot of times that I now these days get much more valuable

(1:03:12) information from completely non-trading related information that I do from you know trading books and stuff like that because I think we all have absorb pretty much all the trading um technical knowledge and fundamental knowledge that you know we're pretty much going to learn and even quantitative knowledge but the interesting insights sometimes come from completely different disciplines yeah that's actually a really good point because at the end of the day all you're doing is finding out stuff about yourself right you know
(1:03:38) right um and trading will definitely expose all your weaknesses that's for sure I always say it will it will expose them raw more than anything in your life your your relationships your there's it it will trigger more buttons in there you'll really get to know yourself it's really really true um yeah anyways Jason I want to keep you any longer you've been wonderful thank you so so much for for sharing such a wide and VAR career and it's great that you're that you're helping a lot of uh retail Traders um it's really really
(1:04:10) fascinating because I also find myself now working with a lot of Traders with doing P you know passing the props and that's been very very um uh rewarding for me because like having people succeed and you know get funded and then and then succeed even better when when they when they get paid out is a really really been a a great process I'm enjoying that I find it very satisfying when when you when you help someone crack crack it and they're like wow okay I've got it and now I'm consistently profitable it's a good feeling it's
(1:04:39) actually sometimes even a better feeling than you're cracking it it's it's it's what I find most rewarding now because I said earlier I don't you know trading is almost a little bit pointless to me you know I'm lucky enough that you know making a couple hundred bucks in an extra a day or whatever it might be it's not going to make any difference to me um and and and that gives me a lot of satisfaction talk talking to people and and getting them through what they're trying to figure out it's a puzzle isn't it trying to figure out what they need
(1:05:04) to do to become consistently profitable and I really enjoy that challenge thank you so much for being with us um is there any spe specific um thing is it it they can reach you at day traders. co.uk is there any place that do you have a Twitter account like uh or X account basically if you just Google my name Jason S it all pops up and my website is dayra ideas. co.
(1:05:26) uk thank you so much for being with us and thank you everybody don't forget uh to please subscribe so that we can bring you more great trading interviews to the trading battle I hope you really really enjoyed this with Jason S who's a veteran who's really lived kind of two different lives the the life pre screen and then post screen and then life sort of as a really institutional Trader and uh then as a retail Trader who now coaches retail Traders help them do the best it's been wonderful Jason thank you so much again for the trading battle the sport slurg
(1:05:54) over and out I'll see you guys in in the markets

T-SHOW Episode 3: Strategies from a trading OG Jason Sen and dating tips from Hayley Quinn - YouTube
https://www.youtube.com/watch?v=VXhJLw7ZQeE

Transcript:
(01:10) Welcome back to the T-Show. We're an episode three where It's time to trade thoughts. I'm Poku Banks, your T-guy, And I'm your second co-host, second T-guy, Gabriel. Let's get it. Today we've got a jam packed episode. We've got many guests flying in from all over the globe, starting with Jason Sen, coming all the way from Thailand, who has 35 years of experience trading the markets, who even started back in the eighties, which will be great to learn from.

(01:36) What else we've got going on? Well, next up, we're going to get some financial news from Felicity, as always. And then Hailey Quinn is going to be joining us in the studio. Now she is the top UK dating coach. We're going to find some links between dating and finance, and you never know, Poku might learn a few things to lock down a girl, finally.
(01:56) No. The girls, they come and come. It's more about the mansions. There we go. There we go. Anyway, it's going to be a great episode, isn't it? Definitely. It will be. So hopefully we'll see you there, where It's time to trade thoughts, with Jason Sen. Yeah. So when it comes to the T-Show, we make sure to bring you the best guests with as much experience as possible to make sure you can learn and take it, apply it elsewhere.
(02:26) Today we've got Jason Sen, with over 35 years of experience, which then means you were trading way before I was even born. Yeah, I'm a young one, by the way. Yeah. I'm sure I was. That means that's eighties, nineties. What was it like trading in such a time period? Well, obviously completely different. And you know, mobile phones didn't exist.
(02:47) Computers didn't really exist. So the Internet didn't exist, actually. God, that's how ancient I am. So I started in 1987. I was 19 years old and I just wanted to get into the city. I basically just wanted to make money. I didn't fully understand what financial markets were, if I'm honest with you. But my dad had traded, so I had some sort of understanding that they existed.
(03:06) And I thought, well, I want to make some money. And it sounds exciting so I wanted to go there. So in those days, you'd send off your CV with your O-level results. And I was lucky enough to get a job with a bank. And I turned up on the first day in my suit and I didn't know what to expect in the next half of the day.
(03:25) I sat there for an hour and then they said, follow us. And we walked across London Bridge, and the next thing, I'm on the stock exchange floor. I was like, wow. So I was quite blown away. That means then, so would you say back then, to even get involved, you had to know someone that was already doing it? Yeah.
(03:39) It wasn't easily accessible. It wasn't… Yeah. That's actually a really good point. That's true. And actually that's… Yeah, I didn't think about that because now of course anyone can trade. You literally just need a mobile phone and 500 quid, you can open an account and off you go. So that's actually a really good point.
(03:53) Yeah. One thing I wanted to ask you is that we heard the term analog trading. That was maybe how it was done in the eighties and nineties. What is analog trading? Well, it was an analog world. The digital world didn't exist really. So well trading, I went from the stock exchange, which had an options trading market, which was quite new.
(04:20) So there was a derivatives market and I learned about options there, but it was quite small. And so to progress really to the London International Financial Futures Exchange—it's a mouth full. Tongue twister. Yeah. That was a very serious open outcry market based on the ones that they had in Chicago. And so yeah, it was so analog that you would stand in a hexagonal pit and shout at people in order to execute a trade.
(04:47) And when you executed the trade, you wrote it on a piece of card and flicked it to your clerk who would be standing around the edge, and he'd run off and then input it into the exchange system so that the trade could be matched with the counterparty. So it was all done with hand signals. So you would do the contracts on the face and the price out here.
(05:07) So if you wanted to pay 25 for 52 contracts, then that's how you signaled to the guy. Because with everyone standing in a pit shouting; I couldn't have this conversation with you in a trading pit—everyone is shouting. You've got brokers all around the edge trying to execute orders on behalf of their clients.

(05:24) So this is the way it worked: There would be booths, phone booths, all around the edge of the pits. And then in the middle of the room, there would be hexagonal pits where various different products were traded. So the guys on the phone with the brokers, they might be on the phone to banks and hedge funds.
(05:40) So the banks might, for example, want to sell a hundred Bunds, which is a German bond contract. So they would phone down to the floor. The guy in the booth would be like, okay, he'd give them the price. So we'd ask the broker on the edge of the pit, what's the size of the Bund. That meant size. And so let's say it was 23223, for example.
(05:57) He'd be like 232323. And he'd be like, size. He'd be like, bid on 200 and offer it in 500. That was the size on your arm. Because he just couldn't shout. So this guy would go on the phone, he'd be like going, okay, it's 223 bid for 200 offered in 500. And he might say, well, buy 400. So he'd go, wait, 400. So the guy on the edge of the pit would then be like, by a hundred, by a hundred, by a hundred, by a hundred, from, let's say he traded with four different people.
(06:24) You had to split the order up. He didn't normally trade with one person. So then the trader in the middle—which would be someone like me, I would be the market maker—would be like, I sold a hundred. And then I'd write it down, sold a hundred, and then I'd give my card to my clerk. He would give his card to his clerk, and then we'd all match stuff on the internal computer system.
(06:44) So that was analog trading. I feel like we need a moment to compress, don't we? Yeah. But I was watching his face a little bit and it was just like Just… I'll tell you what's funny, I still can do the hand signal. That's the thing that we were hoping, honestly. Yeah. I didn't know I could do that. Because I've not done that for a long time.
(06:59) It was like watching someone speaking sign language. Yeah. Yeah. It was your own sign language. It was like a tic-tac system. If you go to the race courses, you see that, and I don't understand that system at all. It's a completely different system. Probably saying that. Well, when I first went on the floor and all these really aggressive guys in these trading jackets, sleeves rolled up, shouting, waving, hands off, I was like, wow, I'm never going to do this.
(07:21) And it's not like you walk into a trading pit and they go, oh, hi, you're new, come in, see if you could make some money. They want to destroy you. They're out to make money, not friends. So it really is incredibly intimidating. And I just wanted to also ask, so leading up to even the millennium, to 2000, there's the .com bubble.
(07:40) Was you ever like interested or involved in that rise up of stocks and in instant stock? I wasn't really involved in the stock market. So on the trading floor, on LIFFE, I traded fixed interest. Fixed income. So I was actually a short Sterling Trader, three-month money, three-month interest rates, the UK.
(08:02) So I was sort of more, yeah, more involved in interest rates and stocks. I was obviously aware of the Internet bubble, but it didn't really… But I did get into the stock markets a little bit more when I got into technical analysis. So when I launched that business in 2007, and thinking I was experienced, because I'd looked to charts for a year.
(08:17) And really I wasn't at all. But it was quite relatively new thing. And retail trading hadn't really, I wouldn't say it had really got going. So in even banks. So I managed to get clients, Deutsche Bank, Morgan Stanley, Merrill Lynch, big companies like that who wanted my daily analysis. And I was really surprised because they had their own departments, but I guess they weren't catering to whatever their needs were.

(08:40) And so in 2007, 2008, I'm providing these reports and they did want stock markets. And I'm looking at this massive head and shoulders pattern just before the global financial crisis. So I'm saying to Deutsche Bank and these companies, guys I don't really understand why, and maybe you can explain to me why, but it looks like there's going to be a phenomenal stock market crash, according to this pattern.
(09:04) They'd be like, no, it doesn't, we are not, that's not what the bank is projecting. I was like, okay, well, I don't know. I just want to warn you guys because it does look like we're going to have a crash. And then it started to happen. I was like, guys, the crash is coming. They were like, really? And you know, obviously it did unfold.
(09:19) And they were like, wow, thank you so much. I think they all did quite well. So you mentioned that you're seeing the heads and shoulders pattern leading up to the 2008 crisis. Where was you seeing that and how was you feeling? Because I could imagine that's the first world, one of the biggest global financial crisis you've been involved in and actively trading by yourself.
(09:43) So how was that whole process of your psychology, having to tell a big bank, oh, you may be wrong, type of thing? Yeah, it was quite difficult because they already just started technical analysis. So some upstart, thinking he's some expert, trying to tell a bank that there's going to be a stock market crash.
(10:01) You kind of feel a bit silly. So a head and shoulders pattern, for anyone who doesn't understand it, when a market is in a bull trend, you are seeing a series of higher highs and higher lows and it's just a nice clear up zigzag uptrend. When that trend potentially changes, of course, you might start seeing a series of lower lows and lower highs.
(10:20) So basically all the head and shoulders pattern is a label for that change in trend that helps traders. Because It's got a label, it helps traders identify it. So a head and shoulders pattern really is a typical new high, followed by a new higher high, and then a new high or low on the pullback. Fine, we're in a bull trend, everybody's happy.
(10:41) Then the market goes up, makes a new peak. Bulls are happy, the longs are making money. Then the market has a setback that is deeper than would be expected in a bull trend. It may not be a lower low, but it may, for example, match the previous low, or come close to it. And it's just a deeper setback. Again, no alarm bells ringing.
(11:03) That's quite normal. It could just be a consolidation pattern that’s sideways. But then you get a run up again, as you would expect. But now you get a lower peak. So the alarm bells are ringing, but still the pattern hasn't completed. You draw at the neckline of the head and shoulders, which is the two lows.
(11:21) When that breaks, that pattern basically identifies the fact that we could have a trend change. It's not a hundred percent foolproof. It does fail. But if the pattern plays out, then you come down and then you start making a series of lower lows and lower highs. You've got to cut a trench. It's a reversal pattern.
(11:39) There are different patterns. So reversal patterns indicate the fact that the trend is going to change and reverse. Consolidation patterns just mean that the market's probably just going to trade sideways. And eventually you don't know when the bull trend will resume. So continuation patterns and reversal patterns.
(11:55) So I was seeing this potential pattern, and then when it broke the neckline, and I said, guys, we've just had the completion of this pattern, and it does indicate… But the size of the pattern is also important. So this pattern was built up over many months, so it was really significant. So, I don't know if you know this, but short term, if you see that on a five-minute chart, it's no big deal.

(12:14) Not that many people are seeing it for a start, because how many people study five minute charts, so you're not going to get a big reaction of it. So the more longer term the chart, for me, the more important the pattern, or the candle formation, the more significant it is. So when I'm seeing this on a weekly chart, this big pattern build, build, build for months, I'm like, wow, if this actually plays out, this is going to be really significant.
(12:35) What was you seeing there? What pair or what? Oh, it was, I'm sorry. It was on the S&P. Oh, wow. I would imagine it would've played out on the Nasdaq and the Dow Jones as well, but I just remember looking at the S&P and seeing it. Yeah. I wanted to ask then, so what would you say you prefer more then: Trading with the banks or their funds, or when you switched to technical analysis and doing your own personal trading? What would you say you prefer? I couldn't do the floor now.
(12:59) I'm too old. You've got to be… It's a young man's game. You've got to be razor sharp, really quick with your maths, and also just physically you have to stand up all day. So we'd been here at 8:00, whatever, finish at 4:00, and there's no seats in the pit. You're standing up all day long. So I couldn't do that anymore.
(13:16) So for me, screen trading is nice. We used to say on the floor, one day we'll all be doing… We knew the digital revolution was coming. And it was like, well, we'll all be, in 20 years' time, we'd all be sitting on beaches trading. We didn't know that smartphones would exist. We thought we'd have like a laptop on the beach.
(13:32) We used to like, joke about it. And of course, that is the real deal now. It is really. And so then when it comes to risk management, that you now have for your own personal trading, you mentioned you risk 1% per trade. Is that swing trading? Taking long positions? Or is it day trading? Or anything like that? Again, I'm quite lazy, so I'm not a scalper.
(13:52) I don't want to sit in front of a screen all day. I'm 55, I've been doing it 35 years. I don't want… I want to have some sort of life. And I've got other businesses. So I've developed a strategy which I kind of call set and forget. And for my subscribers, it works too, because most of them have a job or a business.
(14:05) They're not full-time traders. So I'll get up in the morning and I'll look at the charts for maybe two hours, and I'll try and identify trades where I can risk 25 pips, 30 pips. I'm a trend follower. So the ideal setup would be, oh, we're in a bull trend. The dollar's in a bull trend right now. So I'll look at a dollar pair and I'll wait.
(14:26) I'll hope for a pullback. I'll stick all my fib lines on and my trend lines and my moving averages. And I'll say, okay, that looks like an area of confluence where I think I would be prepared to enter a long position. It looks like a low risk opportunity. I could put my stop here, which is a relatively small stop.
(14:42) And if I'm right and the bull trend resumes, these are my targets. I can get 2R, 3R out of this trade. And I will just enter the order and leave it. I won't sit and watch it. I won't. Because if I watch, I'm like, well, we're not going to quite get there. I'll get in too early. It's that whole FOMO thing that takes over your psychology.
(14:58) And I'll just go off and do something else. I'd go to the gym or whatever. And hopefully I'll get executed on that trade. I might have like half a dozen trades, which I'll enter. If two or three get executed, then I'm happy. Hopefully, at least two of them are winners. So it's all very simple really. If you're listening to this as a beginner, someone like myself.

(15:17) You've just gone in straight in with words like pips and fibs and lines. And if you were to translate that to someone that's never had trading before, how would you explain that morning routine to them? Okay. Yeah. Well, I'm lucky that I live in Thailand, so I'm up earlier than Europe. Most of my clients are in Europe.
(15:36) Well, I've been doing technical analysis a very long time, 15 years, and I've tried everything. I've looked at all the different tools that you can have each Ichimoku Cloud and Bollinger Bands, and all these things that you may or may not have heard of. And I've really narrowed it down because especially as I have a responsibility to my subscribers, I have to be consistent.
(15:54) I have to try to find winning trades every single day. I may not want to trade, but I have to try and identify some low risk trades. So I've cut it right down. My technical analysis involves Fibonacci retracement, which is based… Yeah. Well, that's… There's a Fibonacci sequence of numbers. It's very mathematical, and I'm not mathematical.
(16:14) But anyone who wants to investigate it can check it out online. And there are very simple explanations. And I find Fibonacci retracement levels a very good tool, when I combine that with trend lines, so that's just literally joining lows and highs on a chart to try and identify where traders are coming in at.
(16:35) So for example, you've got a downward sloping trend line. It's showing that the market's in a downtrend, and the market keeps peaking at lower points. So if a market is peaking and troughing at lower prices each time, I've identified a bear trend. And that's something that I can use to trade. And I will be selling at resistance levels in a bear trend, and I will be buying at support levels in a bull trend.
(17:00) And it's my job to identify reliable support and resistance levels in order to execute low risk trades. I mean, in terms of what you've said about the way that you trade then, it sounds like you've incorporated a lot of habits and actual lifestyle into what you're designing in terms of the way that you are patient with your trades.
(17:16) You're not sitting there clicking the whole time. A lot of disciplines is in that. I assume the style has changed in terms of the way that you've traded from going back to the eighties to today. And like you also mentioned, risk management. So in terms of your habits and the actual way that you interact your life, how have you built those disciplines? Everything I've done is through trial and error.
(17:36) Because as I said earlier, there wasn't really many people that you could learn from or there weren't that many books that you could study from. We were all kind of pioneers. So yeah, it was basically by making mistakes. And I'm very ADHD, I'm impatient and I am greedy, and I'm all the things that I shouldn't be.
(17:53) So I had to, by losing, establish all these rules to stop myself jumping in too early, make sure I'm patient, make sure I don't take too much risk, make sure I wait for a good opportunity, make sure I'm patient on the exit, scale out maybe in order to make sure… Yeah, because even when everyone thinks about trading being stressful when you lose money, but trading is actually stressful when you are winning.
(18:15) Because if I'm in a trade and it's working… I might be in here and my target might be here, but when we are here, I'm making a nice profit on the trade and I'm thinking, I don't want to lose that money, but I know that it's probably going to go there. So it’s that, how do hang on, leave the room, don't screen-watch.
(18:39) But I also scale out of a trade. So it just sort of soothes that anxiety. I've come here, and there's now an amount of money in the account that I don't want to see evaporate, so I will just maybe take a quarter of the position off. It'll just make me breathe a bit. I bagged a bit of profit and now if we go to the next target, I'm going to feel happy.

(19:02) You've built muscles, you've built habits that- Remove emotion from it. Yeah. You have to. If this happens, you do this. If this happens, you- I find. Right. Cool. The key is to really just remove the emotion. And being ADHD, I like dopamine hit. So you know- Don't we all. Yeah. But you've got to avoid the highs and the lows.
(19:23) You've got to avoid the excite- If you're trading for excitement, that's terrific, but that means you're trading for entertainment. You're not really taking it seriously as a business. And if it's something you're trying to get into trading for a career or to just build a second revenue stream, I think it's really advisable to examine how your emotions are and how to keep them in check.
(19:39) What pairs do you trade though? I focus on dollar pairs and yen pairs. So well actually, no, I focus on all the major… I do a lot of forex pairs. So the way my system works is I have a criteria to enter a trade. So I won't just look at, for example, EUR/USD Cable. And it's not like five pairs. I'll look at 20, 30 pairs to try and find trades that match the criteria.
(20:06) So I may not trade one pair for months because they're just stuck in a sideways range that I don't like and I just can't identify there. It's just a mess. So I don't have any a favorite pair, for example. I have a favorite strategy or criteria. You mentioned you look for confluences. How many would you say you need to enter? Three? I've got this sort of magic three number in my head and I don't really know why I have it.
(20:30) They're all three. Yeah. There is a sort of rule of three, isn't there somewhere? Yeah, I think. I've probably read that as well. Yeah. Rule of three. But subconsciously, if I sort of see, yeah, fib level, trend line, moving average, I'm like I'm going to go further. Yeah. You don't look at specific trading pairs.
(20:47) You look at quite a large range and you're more interested in the patterns involved. Are you happy to dive in a little bit into how you are able to track such a large volume? And then what techniques allow you to do that such a large range? Okay, so my screen is set up. I travel a lot, so I just have a big screen laptop, and I have two other screens that I plug in, or at the moment in London I've actually, I always bring HDMI cable so I can stick it into the television in a hotel room.
(21:22) So that allows me to have a big screen, you know, a little screen space. And I set things up. So I have daily chart, weekly chart, one-hour chart, four-hour chart. So those are the four time zones that I focus on. Anything shorter term than one hour, I don't really trust the signals or the patterns. They're not really particularly relevant.
(21:42) So four-hour chart is my go-to chart, that's my go-to trend. That time period for me works because as I say, I'm trying to find trades, which I can risk 25, 30 pips, try and make 60, 90 pips. But in order to fulfill that, it's not going to happen in three or four hours. It's going to happen in a day or two.
(21:59) So often trades have to be run overnight, maybe 48 hours. So that's why the four-hour chart is my go-to chart. So for me, I say to people, trade in the direction of the prevailing trend. The trend is your friend. So the prevailing trend for me is basically the four-hour chart. But you have to keep an eye on the daily chart because say for example, you're in a bull trend, but you've been going down for two months.
(22:20) Now on the four-hour chart, all I'm seeing is a nice downtrend for two months, but I need to be aware that we might be able to be about to hit some massive support level, 38.2% fib, 200 day moving average or something like that. I need to know that. Or on the weekly chart as well. I'll give you an example.
(22:37) EUR/USD and Cable have been going up recently, most of this year. So a lot of people, if you are only looking at the daily chart, you'd be thinking, nice bull trend, I've got to keep buying. Every time you get down, I'll buy. But on the weekly chart, if you go back 10 or 15 years, there's this massive trend line, huge 23.6% fib.

(22:54) There's like a 200 month moving average all coming in at this confluence area around the peaks of where the Cable and the Euro just reversed. So I was aware of that but only because I look at the weekly chart and you can only see it on the weekly or the monthly chart. Now since then, Cable and Euro have absolutely collapsed a lot faster than I expected actually.
(23:13) What I'm trying to say to you is you have to be aware of all these different time periods. Yeah. But for me, I would go to the four-hour chart and that would be the one that can give me trade opportunities. So for example, buying into a support level in a bull trend that would fit the criteria that I'm looking for.
(23:29) Sorry, so you're looking at four different time zones, charts. But of how many currencies at the same time? How are you managing to keep an eye on, like you mentioned, your time? Well, I can flick through chart pretty quick and I know what I'm looking for now. I should do. I've been doing it for15 years.
(23:46) So I can click on a pair and I can quickly look and say, daily chart, is it showing me anything, a trend, anything that I can really get my teeth into? Not really? Right. Click the next one. So I might spend 20 seconds looking at one pair and then if I see something like this requires further examination,  then there I'll be drilling down.
(24:07) But don't forget, I do this every day—like most traders. So it's not like I'm going from scratch every day looking at the weekly, the daily, the four hour, the one hour. I've already got my trend lines and my fibs and moving averages on there. And I already know which pairs are sort of on my radar. So it's not like I'm going through 30 pairs every single day from start to finish.
(24:28) That would be five hours. That's right. Yeah. It's like a surveillance room. Yeah, exactly. Cameras, just everywhere. Yeah. Looking forward a little bit, I suppose, towards the end of '23, beginning of '24, are there hot things on your mind that you are already looking at for that period? Even the magic word, AI, becoming more and more prevalent.
(24:49) So I suppose we can do it as a two-parter. The way that's starting to interact with your life, but also just general things that are either intriguing you or scaring you for next year. AI is definitely the big one. Is it in a good or a bad way, actually? Oh, I think it's in a very good way. There's obviously going to be bad players in that technology, but I'm not really focused on that.
(25:10) I've actually launched an AI company, believe it or not, with a small team in Manila, Philippines. Really smart guys. I'm not very technologically minded. I can barely switch my laptop on, but these guys are pretty sharp and I'm just fascinated by the technology. So we're building a little AI company. In trading.
(25:28) Yeah. And we're kind of, yeah, we are sort of financial markets focused and we have one or two bank clients that we're doing, not trading platforms, but obviously because of my background, that is a sort of a niche that we are exploring. And I know that AI is coming into trading and it does really fascinate me, and I know there are platforms that are introducing it.
(25:48) So I'm getting into it, trying to understand it. Aren't we all? Yeah. So far what I've seen, I have looked at a couple of some AI platforms, and for me, I find them useful because although I've got good experience in technical analysis, it offers shortcuts. So although I wouldn't necessarily, a hundred percent trust an AI signal, and the AI can alert me to the fact that I've seen it that way, it'll draw its own trend lines on there, or it'll identify a pattern; this is a flag, this is a triangle.
(26:22) And that's fantastic. And it's also going to be a really good tool for new traders who maybe don't have the experience of where to draw their trend lines and that kind of thing. You can just, oh, click, this market's showing me this, this market’s showing me that. That's fantastic. And then I look at them and I think I like that pattern.

(26:37) That's something I can do something with. So it's instantly saved me a load of time. Some, I might say, no, I don't like that pattern, that doesn't work for me, I don't really believe that those are the right trend lines. It's not a hundred percent foolproof, obviously, but tremendous tool and I'm sure there's going to be big developments.
(26:52) Wow. What an amazing talk from Jason. I personally learned a lot. Guess you did too. A hundred percent. Definitely. Now we move on next to Felicity, where she's going to give you the top financial news around the world. Hi, Poku and Gabriel, it's great to be back with you for another episode and another roundup of the news that you really need to know.
(27:19) Today I'll be taking a look at what those worrying tensions in the Middle East are doing to markets and how they're changing investor behavior. I'll dig into why Goldman Sachs has seen such a significant drop in its third quarter profits. Plus, I promised I would keep a close eye on relations between the US and China.
(27:37) And a new round of sanctions has been hitting some tech firms. Then we'll finish today by taking a look at some of the different pressures on India's rupee. But first, the escalating situation between Israel and Gaza has led to some unbearable news stories over the last couple of weeks. Of course, any kind of conflict also has a significant impact on global markets.
(27:58) Now, those market stories may seem much less important, but traders will still need to follow them very closely. Now, as we've seen with other recent geopolitical tensions, a lot of investors look for safe haven assets to try and protect themselves from any future volatility in the markets. So gold prices are up.
(28:16) The dollar saw some strong performance, although that has since softened a bit. We've also been seeing stock market falls as investors look for safety. And of course, whenever there's turmoil in the Middle East, you get some traders worrying about whether wider disruption could cause problems for oil supply.
(28:33) So we've seen oil prices get quite high, ease off a little bit. At the time that I'm speaking, Brent is still trading at above $90 a barrel. Now, one other thing that's worth mentioning is the bond market. What we normally see when investors are looking for safe havens is a movement towards government debt.
(28:52) That doesn't seem to be happening just now. In fact, US Treasury bonds have struggled over the last week or so. They hit a 17-year low at one point. We've seen a similar story with UK gilts where yields have been rising. Now, one reason for this is sticky inflation. That means interest rates might stay higher for longer, but then there are also growing concerns about the levels of government debt.
(29:15) Let's talk chips, because the US has imposed a new round of sanctions on China. It's halting shipments of the more advanced AI chips to the rival economy, and it's also trying to close any back doors by rolling out similar restrictions for countries that it thinks are at risk of buying up advanced semiconductors from the US and then reselling them to China.
(29:37) Now, there have been concerns in states for a while that exporting tech to China could fuel breakthroughs in AI and might help the country develop military applications. It's only about a year since the first controls were introduced over chip exports. As you would probably expect, this did hit US chip companies.
(29:54) And there were also modest market falls for tech stock in China as well. Now let's take a look at Goldman Sachs. It saw a 36% drop in third quarter profits. That is the eighth quarter in a row where earnings have fallen. Now, I should say this wasn't unexpected. It had said earlier this year; it was going to pull out of its consumer lending business.

(30:16) And it's also had to write down its investment in the lending platform, GreenSky. There were also, I should say, some brighter points in its results, including a 1% rise in investment banking revenues. And the bank was upbeat about its prospects for 2024. And there is just a final Goldman Sachs story I cannot resist.
(30:36) The chief executive, David Solomon, has agreed to give up his side hustle as a DJ. Under the name DJ D-Sol, he had been playing some pretty high profile gigs including the Lollapalooza Festival, but media reports this week suggest he's agreed to hang up his headphones. And he hasn't performed at a high profile event since last year.
(30:58) The Indian rupee had a bad few days against the dollar, ending at its lifetime closing low last week. That is quite a lot at play here. There's a weak domestic market, plus there's that jump in crude oil prices. But traders and banks are also getting ready for a possible dollar shortage. Back in 2022, the Reserve Bank of India, the RBI, undertook a $5 billion repeat swap that matures this week.
(31:25) And that potentially means that billions of dollars could be taken out of the banking system. So you've got the larger banks busy raising dollars now to try and avoid a crunch, if that happens. Of course it is possible the Reserve Bank of India could decide to roll over the swap instead of allowing it to mature.
(31:42) Media reports suggest that most bankers are not expecting that. They are expecting it to mature as planned. It's worth saying as well though, the rupee stayed weak but flat towards the end of last week. Traders have told the news agency, Reuters, that the RBI is likely to be selling US dollars to protect the rupee from falling to a record low.
(32:04) And that is all for me for this episode. I'm sure I'll have updates on some of these hot topics next time, and probably some new developments as well, because from geopolitical tensions to company announcements to currency movements, there is an awful lot that traders need to keep an eye on. In the meantime, it's back to you T-guys in the studio.
(32:30) Thank you so much, Felicity. Now we've got another great guest, Hayley Quinn, joining us to tell us a little bit about dating and it's link to finance. Hayley, welcome to the show. So nice to have you. I just want you to tell the people listening a little bit about yourself, if that's okay. So you are a dating coach.
(32:48) You are also the founder of the UK's largest dating coaching company. It's a thing. Very cool. But not just that. You've been featured in articles on BBC, Sky, done a TEDx talk, author as well for some dating books. And on top of that, you have a regular column in Cosmopolitan. Very impressive CV. And it clearly shows that you know a lot about this subject.
(33:14) But we like to talk a little bit about finance here on the show about, to use the word, people's love of finance and money and investing. And I suppose we're trying to make people fall a bit more in love with the subject, be a bit more passionate about it. And I'd love to know about how you go through that method in the coaching world when it comes to dating.
(33:35) So dating has a bit of a barrier to it. People put up their guards, all that kind of stuff. And your job is to help them become passionate about it and learn those skills. What kind of things can we learn from you that you teach people in that world that we can apply to helping people become passionate about money? Okay, well, I think investing and dating have a bit of a parallel in that they both require a kind of a process that works for you as an individual.
(34:02) And every person is going to be slightly different in terms of their preferences and perhaps what their goals are. You have to have a bit of knowledge. So there's some red flags in dating that we know, and there's also going to be red flags in investing as well. And you also need a degree

of self-confidence to even begin in the process, because just by engaging, as you said with that subject matter, for some people, dating means, oh my gosh, am I going to be rejected? This could be mortifying.
(34:27) I'm going to be emotionally exposed. I'm going to be let down. So when you have that fear before you get started, it's about developing a process where you can engage with it in a way that feels safe to you and gradually develops your confidence. Love that. Some great snippets. So what are the main reasons you see that resistance in the first place? You mentioned a few just then, but are there some key and obvious ones that people can remove straight away? And then we're going to try and see how we can link them into the financial world.
(34:55) Okay. I wouldn't say remove straight away. Because I think that's a bit of, I'm kind of against magic bullets, which is this idea that we can just go, hey, Presto- That's what we really want from you. We want to go- Oh I'm a millionaire. And I think maybe that's how investing is spoken about. It's how dating is often spoken about in the world of social media.
(35:14) That creates a problem because it creates unrealistic expectations. If you have unrealistic expectations in your day-to-day life and process of engaging with dating, you're not going to meet those expectations. Then you're going to find your motivation suffers, and you're going to find it harder to engage again with the topic.
(35:32) So a lot of the work we do as coaches is to help people to develop motivation so they can go, right, I might not become a millionaire or find a long-term partner or just have a rewarding single life overnight, but how can I do day-to-day processes around this, which I'm going to find enjoyment in anyway, even if I'm not on my ultimate goal yet.
(35:54) I think we can learn a few things there, right? Definitely when we're thinking about investing in ourselves, what you mentioned there about expectations is so important. People will sometimes jump into investing and trading, thinking, I want to get to this massive crazy end goal. And when you don't get that quick result, that's a thing that's becoming more and more prevalent these days.
(36:15) You can, like you said, lose that motivation and that can cause detrimental effects for the long term. And I suppose the same vice versa, having too low expectations, might mean that you never jump into it in the first place. I mean, your personal experience, Poku? Yeah. No, also you mentioned processes. So having processes so that every day it becomes rewarding and whatnot.
(36:35) I feel the same with trading as well, because I have a set process where I look for a criteria and if I see that certain things are aligning, then I go. So I think it all links in a way. So definitely if you just… Would you say then, you kind of look to align the way you do in that sense, where if it makes sense to you are not wasting as much time everywhere; you're going for what's highly likely to make you feel a better way? Yeah, so I think it's important that as individuals, it's a nuanced approach.
(37:05) Because I think probably just like investing, there's different appetites for how much risk you want to take, and also different goals and outcomes. So there's not one like uni-process, I think, that works for everyone. It has to be tailored to the individual. When it comes to developing that process and making it feel rewarding on a day-to-day basis, it could be like, what positive action steps can I take towards my goal? So instead of focusing on the end goal of like becoming super rich or falling in love,
(37:33) it's like what day-to-day actions do I take that will help to move towards that goal? And then if I take enough of those actions, you start to get feedback loops, because you're going, oh, that's not working very well, or that is working really well. And then you can refine your process. Where people can get quite stuck is, there's not enough, I guess, top of the funnel.

(37:53) There's not enough initial feedback loops for them to really start to understand. So they may have a concept or a narrative about why they're single. And by the way, I don't think there's anything wrong with being single if you are enjoying it and that's your choice. But they may think, oh, no one wants commitment anymore, or I'm just doomed.
(38:11) And they go in this really self-defeating narrative that will then prevent them from maybe using apps or going out meeting people in real life. They may be really closed off or find it really confrontationally even when someone says, oh, I'm attracted to you, would you like to go out on a date? Because somebody can be like… And in that, that means that they're very sensitive in the area of dating.
(38:35) They're not going on many dates, they're not meeting many people, and therefore they're not getting far enough into the process to really figure out what could actually be holding them back. I want to switch lanes a little bit here. There was some research done in the financial world that kind of took a look at the approach of young people towards both investing and dating.
(38:55) And they found that when it comes to dating, they think much longer term, considering much further in their future, as opposed to investing and trading where they're thinking maybe slightly shorter term. Why do you think that might be? And what are the things that the financial world can learn from the dating world to perhaps take a longer term approach? I think with dating, I think it's because again, when we're looking back to the narrative we've all been given, we might all—well a lot of us, a large majority, might expect
(39:26) that one day to be married or in a long-term relationship. And we see that as like, we are ultimately dating to move towards that goal. Whilst I think there's a kind of get rich quick hustle or an immediacy that we want in our finances, but first of all, both are interlinked because obviously in a partnership it can often be easier to achieve financial goals as a couple as well.
(39:52) And it also means that it's just, again, going back to unrealistic expectations. Whilst we might see like the Lamborghini or something on a nice Instagram reel, that's not necessarily a realistic immediate goal. People also can sometimes feel like they need to achieve degrees of financial security before they then feel ready to date or form a relationship.
(40:13) But most of things, I think these things have to run in parallel. And as I said, finances, whether probably not what you think about on your wedding day necessarily, but it's a core part of a relationship and being a couple as well. Yeah. I also want to ask then, how does one make conversations with your partner about finances, less loaded and not as intense? Because we all know speaking about finances can help you get through all sorts of situations.
(40:39) Yeah. And I think it's interesting because I think finances can be just, it can create feelings of shame of I don't have enough money. And then in other people it can create feelings of fear. I think some people spoke about money as survival tokens. And if you don't feel like you are financially secure, it can actually be a really fearful space to be in.
(41:00) So that's why conversations around money can feel really loaded. And I think it's very interesting in our society. It's probably like the second question we ask someone at a Christmas party. It’s, so are you seeing anybody? We go right in there, don't we? But can you imagine just going like, how much did you earn last year? We wouldn't do it.
(41:18) Which is very funny that we have this kind of intrusive approach, and this, we need to fix your approach, to someone who's single. But finances feel really difficult to talk about. Of course, transparency is great when you feel safe to do so. Again, it's probably not what you'd be talking about on a first date, but I think if you are entering into a longer term relationship, transparency, openness about not just finances, but it could be debt, it could be financial preferences.

(41:44) Different people are—some people are more conservative, some people have a higher appetite for risk, some people have very different spending patterns that can cause problems in relationships. So getting on the same page, also recognizing if you have similar goals and then probably getting very pragmatic.
(42:00) My husband and I, we have a lot of spreadsheets that we share together. I love spreadsheets. I'm in charge of the spreadsheets in our house. I was like, you can do them. I'll just look at them when you're finished making them. Yeah. That's so interesting. Is there a point at which you say this is the right time to start having those conversations in a relationship? Well, I think it's like anything.
(42:22) You need degrees of trust. And trust is a compound thing. Before you start to share what can feel like quite intimate details of your life, you can start also by expressing your own preferences. So I always think that's an easier way to manage these conversations. If you say, so, got any debts? Or how much do you really feel comfortable spending? What's your savings like? It's going to feel really like intrusive.
(42:48) If you say what's really important to me, or something that I've realized, or this is how I like to manage things, and you share, it creates a much safer environment for the other person to share information in return. So I think that's a nice way you can kickstart the conversation about money. And then if you are a couple and you think this is for the long term, it actually makes so much sense to crack a spreadsheet out.
(43:12) That's why we see the rise of DINK couples—dual income, no kids. It's a trend and it's because people are recognizing actually it is a pretty tough economic environment out there. Working together, you can actually, you can save a lot of money and it can become easier to reach financial goals. Yeah. No, I've never heard of that.
(43:32) DINK. Yeah. I'm not a DINK  anymore, unfortunately. I'm a DI. I am a DINK. Wow. Sounds like I'm insulting myself. Don't want to misconstrue that word, right? D-I-N-K, to anyone listening. And it's the important bit. Absolutely. No, that's fascinating. I think I've learned a lot myself personally. Me and my wife, we crack open the spreadsheet once a month.
(43:55) Pour a bottle of wine, take a look at the finances every so often. It's very important. But Poku and I have also gone out into the public and tried to ask them financial questions. And from my own personal experiences, especially in the UK, there are walls up when it comes to money. So I think that everything that you've shared has been really good.
(44:15) Hopefully someone listening to this now appreciates and understands the value of finance within relationships, and hopefully they've got some tips both in their financial life and in their dating life. So really appreciate everything. Thank you so much for coming on. We've learned a lot. Poku knows what he's doing for his next date.
(44:28) Right? Yeah. He's got it. No hesitation. I'll go for the kill. Go for the kill. Thank you so much. What a pleasure. Thank you. I appreciate it. What a show, Poku. Another incredible episode, incredible guests. And I'm going to ask you straight away, what did you learn from Jason? Jason? For him it was more just seeing the history in his face.
(44:59) I can just see where he came from. The transition from analog to signal to screen trading. Not only that, understanding that he has confluences so that just correlates to my trading. So it's just nice to hear someone- Show me some hand signals. So yeah, no, it must be so fun to do. The size. I'm just doing it like.
(45:21) Yeah. But no, it's just great to learn those lessons and to see it from the experience. So it was really good to hear from someone like himself. What about you? What did you learn from Hailey? Yeah, I learned I need to be a better husband to my wife. No, specifically, I think the one thing that was good to hear was about taking that leap, one step further than you're comfortable, because I think both finance and dating, it seems like you need to take a risk.

(45:50) There needs to be some element of risk. So it's just about taking one step further than your comfort level to expose yourself to new experiences. And hopefully that advances your knowledge, your experience and you know, puts you in a better position in life. Whether that's, like we said, in dating or finances.
(46:09) Yeah. Which was really good to know. And honestly, I'm going to take that into my own life. But that was an incredible show. More importantly though, next week we're going to have another two incredible guests. Poku, you want to do a little sneak preview? Yeah. Starting off, we've got Richard Nasr, coming from Lebanon, a full-time trader.
(46:27) Again, someone I can learn from, and put on the stool and get some questions. It'll be great. Yeah. So who else we got coming up? Well, straight after that we're going to have some financial news from Felicity. But our second guest, Iszy Lawrence. Historian, author, comedian, pirate expert. We're not going to go into that any further until we get to that show.
(46:49) But we're going to take a look at the history of stocks and see what that teaches us, what guidance we can get from that. And you know what, I think we're going to have a lot to talk about with her and some stuff to take back to the next dinner party that we have. Yeah. You didn't invite me to your last dinner party.
(47:03) Well, next episode. Next episode. But yeah, I can't wait, where we come again in two weeks, where we get to learn, apply and learn from great speakers, where it's time to trade thoughts. Let's get it Nice, fella.
30 Years of Markets, 3 Maxed Credit Cards, 1 Global News Service | Harry Daniels - YouTube

Transcript:
(00:01) I remember on the floor cuz everyone would be stamping their feet, you know, as the anxiety ro the tension and it would be and then buzzer number comes out the floor just we were short staffed and my head trader went right you take that phone. He shoved the phone in my hand and he ran off down the other end and started trading and then he was signaling stuff back to me and I've got a client on the end of the phone going what have I done? What have I done? And I was like I was looking at my guy and I was I was
(00:30) listening talking to them. I was like going I have absolutely no [Music] idea. Welcome back to the Trading Battles weekly interview series where trading legends, market disruptors, and industry game changers share their raw insights. Today's guest is an absolute beast in the world of financial news. Harry Daniels, former broker, trader, and founder of Livqu, a real-time news service trusted by pros across the globe.
(01:05) With over three decades in the markets, Harry's been on the front lines of some of history's most chaotic, unpredictable market events. So whether you're grinding charts, running alos, or trading off your gut, this one's for you. Let's get into it. Harry, welcome mate. Hi. How you doing? I'm good. Nice to see you again.
(01:22) interested to talk about life squawk because you have a completely different sort of perspective of the markets than I do. I'm a I'm a technical trader and I'm not that focused on fundamentals. So, you can probably teach me a thing or two, but let's start by going back to how you got started in the in the industry. Yeah, sure.
(01:40) It was a long time ago now, so I don't know if I can remember it all. Um, back in 88, I left school with some O levels and GCSEs as they were because I was transitioning over one from one to the other. um and decided I wanted to work I wanted to work wasn't necessarily in the city.

Uh but the only kind of jobs I I got through the YTS which was an old scheme to get people uh kids into into the work environment was at a bank Barclay's bank.
(02:08) No, it was nationwide or net west rather were trying and were looking for computer uh analysts. Uh and the other job was um at a company called Hela, a German bank. We used to call them merchant banks then uh called Hela. Uh so I went for interviews at both got the one at the bank as opposed to the computer programmer. Uh and that was it.
(02:30) I started in settlements which was the back office roles checking uh trade confirmations, broker tickets and all that sort of stuff. Uh and then just you work your way from the back is the old school apprenticeship from the back office to the middle office to the front office.
(02:46) Uh and then I got an opportunity to work on the life floor uh futures exchange. So uh that was in 80 late 88 89 uh and I never looked back after that really. So what did you do when you got to the life floor? You were clerking at first, I suppose. Yeah, I was a clerk. I I do remember when you get there, if you remember this, back in the day, you used to go around the corner.
(03:05) So, it was on the Royal Exchange, but there was another building, administrative building they had around the corner, uh, next pub, and you used to go there and get your your all your stuff, like your badge, uh, your jacket. Uh and they gave you this little handbook and uh this little handbook was this dowel looking woman and she was teaching you hand signals all the basics by sell all that right.
(03:32) So uh I took that away and I was naive as anything. you know, I've literally just turned 18. Uh, and so still naive. And, um, I remember taking all the stuff, really excited, got down to the floor and it was just like, you're going to be, you know, admin and a runner picking up cards and stuff like this. Uh, and uh, I saw the booklet. I got home that night.
(03:50) I was really excited. Show my mom and dad. And then I was like, I won't need that then, will I? Threw the book away and just didn't think anything of it. uh got on my job and I think it was about three or four moments down the line we were short staffed and my head trader went right you take that phone he shoved the phone in my hand and he ran off down the other end to what was the euro market pit at the time and started trading and then he was signaling stuff back to me and I've got a client on the end of the phone going what have I done what have I done
(04:19) and I was like I was looking at my guy and I was I was listening talking to the guy I was like going I have absolutely no idea anyway I I got You couldn't read the hand thing. I I didn't read the book, so I had no idea what he was saying. Not a clue. And I remember he came back. He goes, "Did you feel him?" And I was like, "Fill him what?" And he just, my boss went mad.
(04:42) And and I got sent back upstairs to the back office there. But by that time, I'd realized that I was so in love with uh the floor and the magic and everything. And it was just different. It wasn't an office. It was it was just different. It was this open space, loads of noise, adrenaline filled sort of, uh, room and I wanted to be there.
(05:03) So, um, I, you know, I was a hard worker. I did, I did my job up in the back office. So, you know, let me stick around and then, um, I went and got a job and I went to work for a company called Cargo Investor Services. Sorry to interrupt you, but I mean, we're old boys who were on the live floor for a very long time.
(05:18) So that people who are watching won't understand what what we're talking about with hand signals and executing orders. So just to explain uh there was uh Harry was on the on the phones in the booths which were stationed around the um hexagonal pits which is where the the tra the traders were the brokers and the market makers.

(05:36) I was actually a market maker. So Harry would have be on the phones and he would be signaling to his guy in the pit to try and find out what was going on. So you well you do the hand signal, you'd do size or something like that, wouldn't you? Yeah. Yeah. What's going on there? And if I'm trading the B or the Euro mark as it was. Yeah. Size.
(05:53) What's there? Who's buying? I I I I'd be saying it's like 50 52 bit at four something like that. And I'd be going 2424. That's the bid. That's the offer. And Harry would talk to his uh customer on the phone. Yeah. So I'd be on the phone just telling them what it is. They're asking, "Well, what's the size on the bid?" Oh, well it's two bid on like 500 lots.
(06:13) Two bid on 500. And he come in and say, "Well, show me 200 at five." So then I then signal to you in the boot in the in the pit 200 at five. Um you sell is that way. So you're selling your hands away from you and you're selling an amount at a price. Uh whereas opposed to if you're buying you're paying the price for the amount and so and amounts could be on your on your head or on your arm depending on the size.
(06:39) Um so that was typically what we would do and and so you'd say well yeah you filled filled or you filled. I'd say I'd say you've sold 200 at five or what or if you had like say you had 252 lots at five and the reason we had to do that is because it was so noisy everyone shouting and screaming on the floor you couldn't you couldn't have a conversation so you had to communicate through hand signals even within the pit when you were standing close to people you you often just trade with hand signals because you you couldn't say excuse me how many by how
(07:08) many so you would you would confirm with your hand anyway just wanted to explain that to everybody what we were talking about definitely And then that was that once you got over that was a different language. So you and then on top of that you have to you have the description um description rather of um the different trading companies you know you had the Goldman Sachs or you had uh the tallets the TNT button dynamic button or you had GNI at the time which was uh drinking.
(07:36) There was a number of different lessons time a number of different signals for uh whoever it was that um was trading and and you could see what was going on and it was all that I guess it was all that it was very visceral. It was very you know in your face and and it was that was the part I loved you know uh I wasn't particularly stious I don't think I was thick but I just think uh sometimes you find your your vibe and and the floor was definitely that for me.
(08:08) Uh and uh I I ultimately I excelled I think in in in what I did as a as a broker and uh yeah so went to Cargill uh they I was a runner for like six seven months I you're collecting you're doing the admin basically you're getting the cards from the trader you're matching the ticket from the broker on the booth in the phone uh and making sure that goes together you're matching the trades if you're a if you're a seller like we just sold 205 then there's got to be a buyer there's a counterparty to that and And therefore the trader writes down the card on his
(08:36) cards. He sold 50 here, 25 there, 75 there and whatever another another 25 there. And then that card will get matched with your trailers cards and that would be a closed ticket. So um there was all that to it and then um I as I said I got put on the phones and we had a line cuz it was a very busy um office.
(08:59) We had the floor presence but we had traders upstairs. I used to stand at the end of the booth with a phone constantly on my ear and my job was to quote the markets. I had the buns, I had the euromarks, I had the swishy down that end as well and options in between. And is my job to make sure provide color as they call it. And now color ultimately is making sure it's not just numbers that the traders upstairs or the guys in offices around the world were just looking at numbers on their on their boards.

(09:28) They knew what was behind that. you know, we've got a big seller here. Barclays are coming into the market and doing this. They're buying 500 scale down between twos down to zeros or whatever. Um, and so it was that color constantly all day, every day. But then I'd have orders and um I'd have sometimes on busy days three or four people screaming down the phone at me um giving me orders in any of these markets.
(09:52) And so you had to have that aptitude to be able to separate out one order from the other. make sure you're talking to your traders over there or traders there and and there was an attitude to it and and uh I guess I had uh the ability to to do that. So were you holding three or four phones at a time then? No, at the time it was just the one line because we had the all the brokers upstairs down it was one line with people talking over me.
(10:16) But yes, as you progressed, as I became uh you know, as I moved up the chain, I guess, uh we'd have a um what you could dealer board. This dealer board had something like 36 lines on it, uh buttons that you could press, which were telephone board basically. Um with each one with a different client at the other end of the phone.
(10:35) And so you'd press on the button, pick up the phone, talk to the client, or the line would flash, press it, talk to the guy. And on busy occasions, yes, there were times where you've seen pictures. You got you you have one um phone there, one there. You're signaling orders to your your guy in the pit. You're trying to write your tickets to make sure that you know it was correspond with what the trades are and all this sort of stuff.
(10:58) Um plus you're working on different orders. Yeah, you need more than two hands. Oh god. Yeah, it was. But this was the this was the adrenaline part. It wasn't always like that. there were down down times or whatever but then you could wander around and talk to your friends and again it was that freedom I think you know the responsibility we were given at a very young age again I was 17 18 when I started um and by the time I was 22 23 I was a fully blown broker on the on the phones and and um dealing with large amounts of um money and orders I guess
(11:32) on a daily basis and there was there was a definite uh buzz to it and I loved it every you know the camaraderie um that again that ability to not come and go because it was you had to be there to man the phones but you know there were three or four of us in the we looked after each other we looked after our traders they looked after us um and it was very much a team effort especially where we were funny enough I've I've organized a a reunion this Friday so um we're all getting together this Friday nice okay so after the floor shut. You moved
(12:06) on with a a new idea really. Well, before that I mean I left the city um and I s I sort of went traveling for a bit um and then I came back I got work and I was working IT services. I actually left the city completely went into IT services got a job on sales doing sales and it's relevant to what I'm coming on to and customer service and um it wasn't you know the buzz wasn't there that adrenaline there you miss that that ability you know 130 would come on a Friday the first Friday of the month and whereas every first
(12:44) Friday of the month non-farm payroll is there and everyone this this that the dealer everyone's waiting before in terms of an opportunity to trade, an opportunity to do business. One day we're coming and I'm eating my lunch and it and it and it's just not the same. There was not there wasn't that buzz. Um I got an opportunity to go back and and trade for a prop firm um which I did make Global back in the day.
(13:09) I did three years as a fixed income uh trader. Um and when that finished, couldn't make any money. couldn't really not consistently you know uh that came to an end and I was really just looking around searching in my early 30s at what I wanted to do. Uh I splat with my girlfriend nowhere to live really cuz we we rented a place.
(13:34) I had no money and a friend of mine said oh so and so is looking for someone to do the squawk. Uh this guy was Batesy. Um and Batesy was a renowned person on the floor. I'm sure people have mentioned him on your podcast before. um and but he was looking for an assistant to help him call trades and squawk u market info. So I went to see him.

(13:54) He went, "Oh yeah, yeah, no worries, son. I'll put you in touch with um the boss." I went to a company called GH uh financials and they took me on and I became um a stalker from there. Uh and that was good. I did that for a couple of years. Then they shut down the office and the desk and so I was redundant again.
(14:13) And I was like I was just getting to the point where look I don't want to work for someone else anymore. I don't want my fate in someone else's hands. Um so and I liked what I did you know I thought I was good at what I did. It was similar to what I'd done at the very beginning of my career on the floor.
(14:29) And so I went about setting up my own company and my own squawk service. Now you remember this is in the early naughties. So about 2002 2003 technology hasn't hadn't the technology was there. Most of the traders now were screenbased. Uh the floor days had had come to an end really. And so um it was a matter of like right well how do I get this going? I've got no money.
(14:53) Um but I know I can get some business in. I know I can convince people that this is a service they need. So, back in the day when you could still get 0% interest rate uh in interest on uh credit cards, I maxed out three cards. So, I maxed out 10 grand on the first card to help pay for everything I needed and to to pay my costs and me getting to work and everything else.
(15:15) And then I got a second card to pay off that first 10 grand and then a third card. And so, I was every month I was just juggling these three cards. I wouldn't advise it in a in a non-zero interest um 0% interest environment, but back then you could do it. when I built up the business uh basically and and got more and more customers on board, paid off the credit cards and um set up um my first company which was first call market squawk uh before we uh got to live squawk ultimately and just began um really uh broadcasting to an audience of uh
(15:49) traders and I sat amongst traders as well. I was in an office, fortunate to uh to be in an office with traders around me. So calling out the numbers, they would shout and say, "What's going on? This market's just moved. There's been a spike in that." And and they were my eyes and ears as well. And so um yeah, and brought the business up from You really got to understand exactly what information traders needed. Okay.
(16:11) Absolutely. And obviously, you know, yeah, it was one of those sort of things. I always thought I knew as a broker, you you know, I've got a fairly good idea what the big uh guys, you know, we used to trade for some of the biggest funds in the world, some of the biggest traders out there who had thousands to move the markets.
(16:28) And so it was it was almost easier when you have that kind of size and that kind of power um at your at your fingertips. I I did forget I actually did work in Chicago as well. So, you know, futures started in Chicago and I worked on the CM and CBOT in the mid '9s and got to see the old school the old school um traders um really plow their trade and it was apply their trade.
(16:52) What did you learn from them? Uh well, there's Tom Baldwin who's in uh Market Wizards, possibly the biggest trader that there was at the time trading 30-year uh government bonds, US 30-year treasuries. Um, and what I learned was composure. I learned you do things at your pace. One of the things I learned ultimately from working um, on the floor and in those pressure environments is you can only go as fast as you can go.
(17:19) There's no point trying to do 100 things at once if you can't cope. Make sure you you have that coping mechanism to slow everything down and to do everything in it, you know, and and ultimately not to rush and and that would still be in goodstead. I think outside of work environment but as much as don't panic you know just do be systematic get things done don't panic and it will it will come and if you make a mistake you'll have time to sort it out you know so it's just really making sure you order stuff in your head uh and and and don't situation yes stay in your
(17:56) comfort don't always try and retain control of the situation uh and it applies for a lot of things in But it it I learned it on the floor, I think. Um because there were occasions when things would get out of control that we had situations like uh when we fell out the RM, the UK fell out the RM in

'92. Uh one of the greatest days I've ever experienced in a market dead and now despite G the global financial crisis, everything else that day was was just insane.
(18:32) I remember it not to finish. Well, you know, you you were down at Sterling in I think weren't you at the time or I was short Sterling Options. I remember by Friday I was so exhausted. We done really well. I just didn't have the energy to stand in the pit. I I came in for an hour or two and went home.
(18:47) Was I was that exhausted and I mean I was a very I was a young man. I was 24 years old or 23 years old. But it was great. I couldn't speak. We shouted so much all week. I couldn't get the words out anyway. Even if I wanted to trade, I couldn't speak. Um, you know, going back to just referring back to the the dealer board, I remember because we I've worked for big companies.
(19:07) I worked for Cario, I wor on the floor, two big brokers out there. We had big client lists and and did good size. And I remember on the I was at Cargill and the board we had two boards and um when it started kicking off the board shorted cuz every client rang was ringing at the same time. Wow. So you just saw it.
(19:30) It went bright and then it went poof and all the lines went it just shorted out all the bulbs. It was that kind of day. Yeah. That's crazy. Immense. But again, it was a lot of fun. Yeah. So going back to the future effectively. So the CME CBT taught me a lot just about really other markets, other ways of doing things. You know, we all traded futures in London and in and in Chicago, but there were different Hans said was there were different styles.
(19:59) There was different ways of putting trade. It just broadened your your horizons both personally and professionally, you know, and and uh I love Chicago. It would be my second home if I'm honest. Uh even in the winter, uh and it was a great it was a great place to to learn and and experience. So that was good fun.
(20:19) Um but yeah, getting back to the the uh to the here and now or getting forwards. Um all those all the skills I'd learned even in the IT services, doing sales, ringing people up, all lent into the into starting up my business, cold calling people, getting people to to to take trials of what I was doing and convincing people that this was something they would need.
(20:40) Um because it was hard at the at first. There was one or two other school services out there but we weren't well known uh as an industry uh and people thought well I've got Bloomberg got Reuters I don't need you lot what was the difference between that you offered or still offer to traders um you know what why is it not good enough for me just to have Reuters and Bloomberg look first of all this screen real estate um you've only got so many eyes and you you have so many things you're looking at if you're trading and your chart looking at
(21:09) your charts and everything else that sometimes that ability to to take in the news and and understand the fundamentals is hard and you know it's hard for anyone. So we offer the kind of service where we're an extra pair of eyes and ears. You know we know the scheduled events.
(21:26) We have a calendar that you can look at and understand what's going out when but we're also there when you're busy trying to get in or out of a position and we can alert you via our audio um news service. And just quickly to the way it works is uh you log into your uh into the platform, there's a little player, you press the button play, and you then have a box and a player, and anytime something comes out that's relevant to your market or your asset class, um you'll hear us talk about it.
(21:56) Uh we're not a radio station, so we're not constant, uh we'll only talk when there's something worth saying. Uh, and if there are like Trump comments of of late or the German election debt break um situation, we're there to scroll through social media and all the news services to try and bring you and aggregate down um what it is you need to know for your trading day.

(22:20) Uh, and it's really just to try and be in another alert system there. You know, we're not there to make you money. That's your job. Uh we're there to try and help you not lose money uh is probably the best way to to put it. Yeah, we want we we provide timely news. I was going to say with right now with with Trump tweeting uh and you know and those tweet you know a single tweet can move various different markets.
(22:41) It's pretty vital to know what's going on and like you say you can't possibly and these days people are trading from their phones as well. So you can't possibly be looking at news services while you're watching your MT5 platform or whatever it might be. And the social media thing, I I didn't even think about that.
(22:55) You know, there's way more Reuters in Bloomberg now. There's so many different social media channels, so many different accounts that you've got to follow to stay up to date. Absolutely. I mean, we've got a classic example today and the markets have reacted or or been preemptive to it for the past um few days, I'd say.
(23:15) Uh and that's Liberation Day. You know, make America rich again, I think it is, or wealthy again um as its other name. Uh and that in itself is shifting uh narrative and and really taking investors um will just gu investors are now guarded ahead of uh this announcement uh which for anybody doesn't know is going to be at 400 p.m.
(23:40) Eastern time 10:00 I think it's 10:00 uh central European time uh tonight. So, and it's really going to lay out Trump's vision for uh tariffs and and really try and uh again what he sees is get some redress for what he he he he terms uh unfair taxation on trade. Also, he the aim is to try and uh make Americans uh buy American products and to produce that are produced and manufactured uh in America, you know.
(24:14) So um and that's going to have ramifications globally as America's the biggest economy in the world um and and is has a lot of influence in the world. So um the ramifications for that are going to be and reverberations will carry on uh for days I think potentially or uh as we've seen from uh past events that um just fade out and until the next till the next time he speaks if I'm trading you know S&P 500 or something um I'm going to need you on in the background because each each announcement about tariffs or whatever could could do all sorts to the
(24:47) indices to the dollar and I can't possibly sit there looking at Twitter and watching, you know, the Euro US dollar and the S&P and whatever moving around. So, if I've got that coming into my ear, I' I've got vital information. Yeah, it's just again, it's a it's a warning. It's, you know, it's the canary in the coal mine uh sort of thing.
(25:06) Listen, as I said, we're not there to make guys money, but if you have a position, you could be the best technical trader out there in the world. Sometimes there are just events that that that run everyone over. uh and but it's being best equipped to deal with that and understand that you know you may not do anything as a technical trader to change what you're doing but you have a better awareness of what it is that's moving the markets around.
(25:28) Is it a technical um move or is this more is there something more to it? Uh, and I just think that's where we're best equipped to help um, day traders and investors, but day traders particularly understand what's happening, why it's happening, where, you know, where it's coming from, and just so they're not they're not surprised.
(25:49) Uh, that's the idea. I mean know we don't know things coming out before before they happen on on in some instances but where we do know where things are scheduled a quick reminder here will say look there's a 10 10 minutes from now you're going to get some um US data on the wires uh this is what's expected this is what it was last time there was a 3minut warning there you go we're coming up to it now uh just be aware top of the hour this is happening and then when the data comes out for example we'll announce the data we'll announce any revisions we'll tell

(26:17) you if it's a beat or if it's a Same with earnings uh that come out on a quarterly basis or company news, you know, energy uh news as well. You know, what happens with OPEC, what happens with the EIA figures, uh inventory data every week, um agricultural stuff as well, just anything that that these our guys trade that they they want to have a to.
(26:42) If I'm a relatively inexperienced um retail trader trying to get to grips with technicals and fundamentals, you you're not just throwing out, oh, US non-farm payroll number came out on this 312,000. You're actually educating a little bit as well. That's stronger than expected. So the dollar could could be stronger, that kind of thing.
(26:59) Is that is that what what you do? Yeah. Listen, even the most seasoned traders can't get across it all. So to to have us there, we get a lot of bank researching. we can digest and then I said uh we push out and filter out the the noise and and give you the personal bits of information that will help um that hopefully will help keep you aware of what's happening and understanding of what's going on around you, you know, and but we also have reports and re previews and reviews where you can read up on on on stuff as well. just not only
(27:33) the audio side, we you know we we we're there to to offer um as I said just previews and a bit of insight into behind the numbers or behind the event so people have a better understanding of what's happening and we have a calendar as well but uh yeah you were saying yeah I think it's a really important service because um you know I coach traders as well as provide signals and whatever so my subscribers are often saying to me you know oh why did gold do this or why did the dollar do that and you know I'm not in touch at all I really should be
(28:01) listening to So then I'm going through Twitter trying to find out and trying to explain and um you know I don't have a grip on the fundamentals the way you do. You you clearly you know I can't imagine there's many people who understand it better than you because you've been doing it for such a long time.
(28:14) You've watched every single news event. What would a typical day be? How long are you probably you're running a business now so I'm guessing you're not squawking all day long yourself but but you know certainly when you started what would a typical day be like for you? Well pretty when I was on my own uh I used to start at quarter 6 to prep.
(28:32) So I'd be I'd be at my desk by about quarter past half past 6 prepping the the coming day. Um service would go live about quarter to uh 7 when the typically the futures markets uh opened. Uh we cover any data uh back then. Uh and I'd be there until typically about half 6 7 um we because I was on my own I couldn't cover the US session.
(28:55) As soon as I got enough business in, then I got another an assistant in and we and we um cross over stay to the end of the US session. Now we have a 24-hour uh desk or a service. So we're there we start Sunday evening for the because in Europe Sunday evening for the um Asia start of play at Australian day and then we finish on a Friday uh basically when the US markets close.
(29:22) So, you know, we're there constantly now uh throughout the week um in all time zones to to sort of aid traders. So, our our customer base is global. You know, we have a news feed as well. So, if you if you're away, you can come back and you can search and look for key comments or key um protagonists and and and look at what they've said whilst you've been away.
(29:45) All these sort of things um we do now as a service. You know, I've also sat at press conferences for central banks. I used to, you know, attend the ECB, ask questions of Mario Draghi back in the day or, uh, Carney. Wow, I didn't know you did that. Yeah. So, um, we had a service a few years back, uh, whereby we would report from the central banks.

(30:10) So, uh, I typically you go over to Frankfurt for the ECB and, um, you you get the, uh, the decision. You could then process that, write it up and then as it, as it was announced, you push that to your clients. Same for the Bank of England. I went over to the, uh, to Washington for the Fed and used to to cover that as well. So, it's Yeah.
(30:33) So having talked to Carney and when he was the central Mark Carney when he was the Bank of England central banker to see him now as the president of Canada um you know these I've talked to some influential people and and you know ask questions. What did you learn from going to the flying around the world going to these central bank meetings actually speaking to this to you know the head heads of central banks that's that's a hell of a an experience. It is.
(30:59) And for listen, I I've actually sat in the room that non-farm payroll gets released from. Now, if you go back to when we first started and we've and and we were all waiting there at, you know, 127, 128, 129 waiting for that non. And then I remember on the floor because everyone would be stamping their feet, you know, as the anxiety rose, the tension and it be and then the the buzzer the number comes out the floor just erupts.
(31:28) So it just to now sitting in front of the central banker as as uh or or or as that news is released that's quite a journey for you. Yeah. And so you you you you see you see it from my perspective as a as a broker, as a trader on the floor at the at the at the sharp end and then you go and you talk to these central bankers and you you ask them questions which they rarely answering uh directly.
(31:53) They're very very skilled at um giving you what they want you to know. So you have to read between the lines to understand what they actually really mean. um to go from there and as I said for non to be in that room which is the most unglamorous room in the world when you think about the amount of money it's made or or or lost people and you go in there and it's this little government office with tatty carpets and four mic you know tabletops and everything else it's so anti what you'd expect it to be I didn't actually realize sorry to
(32:27) interrupt you I didn't I didn't realize there was a specific room where these numbers are released. So, is that is that are there people from the press in there? I I I thought someone just clicked a button and it was released. So, um there's you you you have to go into this room uh an hour 45 minutes before.
(32:46) Um they give you the they obviously phones at the door. Um no internet connectivity, no outside world interaction. Uh you get the report as it is for farm for example. you get the chance to look at the number, write it up there, prep the machine, prep yourself um ready for it and then uh it's then they lift the embargo, lift the internet connectivity so that you can connect again and it's that's when it's released to to the public.
(33:12) Uh same with central bank events. When you get interest rate decisions, uh you get into a room. Sometimes they even bring you an economist who for Bank of England for example, an economist would come in, explain some of the reports. It was a monetary policy uh report and NPR for Bank of England for example, they come in and take you through the points that they want you to sort of highlight.
(33:34) uh really and I said that's when you have to look through um what they're trying to say in order to really get at what what it is they're not saying uh that your audience you're trying to read between the lines of these meetings. Exactly. Exactly. Yeah. So, but you're there for an hour and a half on big events and and in these in this room looking through the stuff and just going, "Wow, okay.
(33:58) " and and trying to condense that down into a a readable uh and digestible piece of information that get a nugget that goes out there to um to your audience and it's hard work. you know, journalists do it's a tough job at times. And any any memorable any any like particularly memorable events, any piece of data that you could sort of read through the lines or you you know you pleased with yourself, you've done a good job.
(34:25) You know that all these trader friends of yours and your clients are all listening to you and you're sat there and you have a m the microphone comes to you and you know the world of the trading world is looking at you and your question to uh a central banker. you make sure you got to get

that make it a pertinent question cuz being an ex-trader and ex broker I know what they want to hear from the tra from the central banker you know sometimes with journalists that it can be a bit fluffy they they they you know their questions take longer than the
(34:54) answer they get back from um the person they're asking whereas I think with my background I was I I I was fairly direct you know you know uh and and kept it fairly direct in terms of the questions I asked and sometimes Sometimes they give me a a decent answer. Sometimes they they they don't want blunt answers because blunt questions because they they don't often give blunt answers.
(35:19) Um but it was that was what I'm most proud of I guess just being there knowing that we we were down the pecking order. So sometimes all the questions you had I'd have I'd typically go in with 10 questions uh and ones everyone would want to ask and you know we're not going to be ahead of the Bloombergs or Reuters.
(35:38) you tick off that question and that question then by the time you get to you you're on your eight for ninth question you're just going crumbs if uh um am I going to ask a sensible question and there are occasions when you get to your question you think oh great I've still got a decent question and the person before you ask that question you've got nothing and then your mind's blank and it's like oh my god what am I going to ask him now what do you have for breakfast so you got to think on your feet and again that's the craft from the
(36:05) floor days don't panic just compose yourself and just go right okay what would my audience what if I was a trader what would I be asking him now uh and maybe ask it the same question in a different way to one of the other journalists so I'm proud of all that I'm proud that but you know from a oneperson uh company you know at one point we were I think 23 24 staff um handling um three or four different channels and everything else so and I did that I started that, you know, from literally credit card. Yeah. Boring
(36:41) credit card. I love that. It's a great story. And employing people employed people, you know, as I said earlier, you you've clearly got a hell of a lot of experience. You you've watched news come out and you and you've then watched the market reactions. I would imagine you must have some sort of six sense now.
(36:58) For example, and by the time this goes out, the non-farm payroll number on Friday will have already been released. Uh but how how would you be viewing that right now? What would you be expecting? How would you be expecting the markets to move dollar, you know, the um stock markets? Do do you when you see a piece of news come out, do you think that's that's going to push the dollar or that's going to do this? Yeah, I mean to be fair, I don't think you can see past today.
(37:23) I mean, Liberation Day today is the be all and end all everything. And I think for once, non-farm is the second biggest event in a week. and and ultimately by the time we get to Friday and that non comes out the market will may well have played out and it it may almost be irrelevant depending on on what's said uh later today. it may almost be irrelevant because the jobs at the moment whatever happened again that's backward-looking uh and you know this is something that's happening in the here and now uh in terms of the tariff uh and the trade war
(37:55) potential trade war so that I mean that that pervades everything uh I think so for once uh in a month I don't think non-farm is as important as it normally would be say next month how would you be preparing for that what would you what would you how would listeners for the editorials, you know, we look at this stuff um way before.
(38:21) So, we prepare uh our preview um a few days beforehand. We then get all the bank we'll do our uh bank research, go through all the bank research, get all the estimates from the biggest banks, um put that into a chart for our audience. they can then have a look at what it is that these different banks are saying uh and the and the range as important as anything as the consensus, the median estimate um for the data itself.

(38:48) Uh and then we'll push that out the day before and make sure our audience, our customers know what's happening, what's expected, if there's a whisper number. And a whisper number being a number that, you know, back in the day people used to think, oh no, it's been leaked or something, someone's got a number out there.
(39:04) It's not, you know, these things are very tightly um orchestrated and and you don't get leaks. As far as I'm aware, I don't think you've ever had a leak on on nonfarm. Could be, but that's just my, you know, uh my take on it. But uh um and so you just prep your team, you you you get yourself ready for the numbers. You look at the impacts just generally by the time a number hits, you've had a lot of the play take place beforehand.
(39:32) That number is just a um I get the end product that comes up and and whether it was close to the mark, whether it was way away from the mark will determine the the volatility that you see in the markets thereafter. But for us, that number hits, we we we announce a number and uh we let the traders do their thing.
(39:55) Um but you know, I'm privileged in this job. I have a job that means I it's like windows on the world. I get to see what's happening at any single time. uh day or night in the markets or even beyond the markets geopolitically or um on on a human level, you get all these different stories coming at you all the time.
(40:13) And I couldn't find a more interesting job if I tried. Yeah, I can imagine. So, you're never tempted to to go back to trading with all the knowledge that you've built up over the decades. Um tempted? No. Um yeah, you're always every now and again you just you get that little taste of it and you just think, "Oh, if I could I would.
(40:31) " and you know, maybe I will once my uh my career in this is over with, but I I don't know if I need that level of stress in my life. And and listen, if I was any good, I'd have still been doing it, you know. I just there's horses for courses, I think. And and for me, um maybe I haven't got the temperament for it, you know. Not everyone has.
(40:51) Trading never gets easy. I can tell you that. No. Okay. So So if um let let's say I' I've been trading for six months. I'm trying to learn. Uh I don't have a very good understanding of the fundamentals really. Uh what would you say to me on how to progress, how to move forward, how to learn about fundamentals and how they affect markets? I think very simply read, you know, there's nothing better than to to whether it's the FT, whether it's the Wall Street Journal, um New York, whatever, just sit down and just take in a little bit every day. Just
(41:25) have a have a read of the the headlines. have a read of this and then apply it to what it is you are trading and just have a look. Oh, on this day that happened and and just start off there. Find yourself an experienced trader. Go out there, connect with people. We're in a far more social world now than we've ever been.
(41:46) You know, back in the day when we started trading, it was it was a more lonely event. I mean we you know I traded as a prop trader with people around me and we had the tools but if you're sat in your room uh trading talk to people reach out and talk to more than one person because everyone's got an opinion. So understand firstly find your own information out.
(42:07) So again as I said read the newspapers uh and just if you don't understand it all take a little bit and then find an answer for it. Find out what that means. You know some of the best economists some of the worst traders. So, it's not it doesn't necessarily um equate that because you know economics you're a great trader. They're two completely separate skill sets.
(42:29) Both valid but completely different. But understanding what it is that's moving the markets, potentially moving the markets or could potentially move the markets is never a bad thing. Knowledge is never a bad thing. Um you know, is how you apply that knowledge is is the issue.

And do you think social media is a positive uh for for traders? Should they be monitoring social media channels or could or can it just get too confusing? It can get I mean that's why we're here.
(42:55) We filter the news out so you don't have to. But in terms of um the noise, there is a a lot of noise out there. I think it's something for the good. I think democratizing the news um and the Bloom is will me for this but you know the it's prohibitive for many many traders to to to trade and and I find that and so they're getting run over by the the the money and again it comes down to how much money you have and the resources you have and the banks will run over the small guy every single time because they don't have the resources and so you got to learn to be
(43:27) nimble. You got to learn to understand what it is that the big boys are looking at. Don't trade the way the big boys do because you can't. And girls, you can't. It's not it's not it's not the same. It's not the same dynamics. They're not they're not triggered um by the same events that you are and in the same time frame as you are.
(43:49) So, but understanding when things change, when there's a sea change is is always and that's that's awareness, that's understanding price action. it's also understanding fundamentals and understanding the news and understanding what the piece of data um means to to the market on overall on the whole.
(44:08) So, it's, you know, again, as I said, I just think you have to arm yourself with as much as you can. Um, and and sometimes it gets in the way and you got to understand the way you trade and the and and and the way you see things because listen, I'm not particularly uh as said, I was never an academic, but and it didn't show my results at school, but um I have an understanding.
(44:33) I can look at and read a piece now and understand a lot better, but you start throwing loads of economics at me and all this sort of stuff. It goes over my head, too. It's not it's not that easy for me to take in. I'm a visual person. Um, so I'd rather see stuff than than read stuff necessarily and and or sorry, hear stuff uh as opposed to just reading reams and reams of stuff.
(44:59) find what works for you, you know, and I I think that it's really important that you you don't try and force yourself down one avenue that you're not comfortable with, you know, because this job involves discipline as a trader involve discipline involves just knowing yourself and and by knowing yourself, you'll learn the right way.
(45:19) You know, it's hard to explain, but you know, as I said, for me, I I I couldn't be an economist. I that wasn't my my gift. But I I can I do know what a headline means. I do know when a market moving comment comes out. Uh and um why my listeners need to know it. Last question. You said when you uh earlier in the interview that when you first set up um first call you uh you you were in a in a one of the prop uh firm. Yeah.
(45:48) when so and you were there not with your finger on the palace on the news and high pressure because you've got your trade your traders are there in front of you and they're shouting out Harry what's going on why has this done that why is this you must have learned quite a lot from being in that environment with traders shouting at you and know exactly what traders wanted to hear you know did you learn anything from that from what traders really need and what they want and how they react yeah it changes every every day um no what they
(46:17) what they They just want to they they want to know the headline in its simplest form. Don't give me all this preamble. What is it? You know, one of the the the things we used to do is if we know non-farm is coming out at half one, I'm not going to say at half one and the non-farm number. It's like the first thing out my mouth when that that clock strikes half past 1 is up 130,000, down 200,000. That's it.
(46:48) That's the first thing you come out. So traders want that insty. They need that insty. They're up against alos. They're up against bigger players. They need some kind of edge. So traders want an edge. Um when I was getting shouted out, it's but they and they will come at me and say, "Look, the DAX has just moved for this that and this other reason.

(47:07) " Sometimes the DAX moves because there is a a paper what we call paper um a big uh big bank or whatever that has to offload a load of uh shares. Sometimes that's that's what it is. It isn't a fundamental reason. It's it's a position and it has to and and and position and I know this as a broker uh that I had orders sometimes and I I remember I did an order in the buns once and I I moved the buns about a point and a half um on my own.
(47:36) My client did and uh the power I was power hungry after that. It made my name. That's what made my name. That's what everyone stood up and and saw Harry because I handled this order and it was it was a huge order in the buns. How many futures did you sell? No, I bought uh I was buying and I think and back it was relative but I think I bought back 15,000 buns um in a day and this was back in the day when 500,000 lot would move the buns.
(48:04) So it was and and this order came in and it was in bits and pieces and and they just keep buying it more. Yeah. buy me another f buy me another 2,000 another 3,000 right total was 10,000 total was 12,000 and it was just and and I lift I was buying this thing and and it was it was honestly it was it was f it was one of those sort of days that I I will never ever forget in all the years working over in Chicago was an eye opener just seeing the vastness and the scale we thought London and financial futures in London were big then you go
(48:36) to the home of futures and you you work in Chicago you work on the Euro dollar floor which was the size of a football pitch full of about 5 to 10,000 people I think at any one time. Just the Euro dollars. Yeah, it was it was immense. It was immense. So that was probably the size of the live trading floor was just the Eurola bit. Yeah.
(48:55) You couldn't you couldn't be heard down the other end. You had to have two booths. One for the fronts and one for the backs in terms of that. Oh, really? That's crazy. It was just immense. So you could be trading Euro dollar pit and not know 50% of the people that are in the pit. No. No. I mean I it was it was and it's just a different it's the cultural thing as well going over there.
(49:17) You know we used to wear certain ties and and all this stuff over there. They used to wear golf shirts and because they generally were going off to play golf when the floor shut uh and a token tie just to uh you know to show they were wearing a tie and they wear chinos and stuff whereas we Yeah.
(49:37) But it was but it was just the fun I had the people I met. Um and it again it's one of those sort of industries we are fortunate that we meet people from all over the world. Uh and I and I that can only be a good thing. You must have a hell of a of a black book with with the contacts that you've made over the years. Um, right.
(49:53) This is genuinely the last question because I think we have to wrap it up. But are your Live Squad customers are they all retail traders or do you have some some of the some companies and bigger you know the bigger players out there? We our client base ranges from tier one banks through to retail. So again they want different things from us you know and we and so we cater in different ways to the to the service but ultimately we are there as an audio news service that is that alerts you to um what's happening at any one time but yeah our client base is is
(50:27) broad. Uh we have a number of products. We got the macro product which covers everything and gives you all the asset classes as well as the uh the data uh and the calendar and and the reports and but we can filter it down. You can filter it down if you're a retail and can't afford that level of service um to just the audio and you can then just listen have it on in the background.
(50:49) As I said, we're not a radio station so you won't hear us all the time. There will be lots of dead air but you'll know when we speak because um it matters. Well, I know it's a terrific service and I do highly recommend it, especially if you're, you know, some of my subscribers who have pushed me to teach them about fundamentals.

(51:05) I think you're the man to teach them. How do people find you? How do people find Livqu? Well, uh, lives.com. lies sqa wk.com because you don't know how many people can spell squawk wrong. Uh, so you can find us online. We're on LinkedIn. We're on X uh, Blue Sky. You can find us at Facebook, all those channels. um and come and have a trial.
(51:28) We do um free trials for for customers. Uh and we got different levels of service. We got an FX um channel as well as the macro uh channel. We have um several other channels, Trading Floor Audio, which is a different service delivered in a slightly different way by a veteran of uh 30 odd years. Um uh Paul Johnson or Batesy as he's known.
(51:51) Um and so there there's a service for everyone and and a price for everyone. Uh, so try us out and just see if it's something that uh can help your trading day. I thoroughly recommend it. Well, Harry, always good to chat to you. I think I owe you beers. I think you paid for them last time, so hopefully I'll be able to catch up with you when I'm in London next.
(52:07) That sounds good. Looking forward to it. Okay, that's it for this episode of the Trading Battle podcast. Huge thanks to Harry Daniels for sharing his incredible journey and insights from spotting the gaps in the market intel to building a new service trusted by traders across the world. Harry reminded us that sometimes the edge isn't in the trade itself, but in the timing and clarity of the information that drives it.
(52:29) If you want to avoid getting blindsided by breaking news, check out Livesquawk and follow onx. Thanks for tuning in. Don't forget to subscribe, share the episode, and leave a review if you found it valuable. We'll catch you in the next one.
How Pros Use Technical Analysis for Short-Term Trading: Jason Sen | Two Blokes Trading Ep. 11 - YouTube
https://www.youtube.com/watch?v=x_QIzj3a2GM

Transcript:
(00:00) So, if anyone's watching this, please, please, please just don't do that. I had no idea what I was doing. And I very quickly lost about £30,000, which made me realize I am delighted to welcome Jason Sen, who's a veteran trader and technical analyst with over 35 years experience in the financial markets. He began his career in 1987 at the age of 19, trading options on the floor of the London International Financial Futures Exchange Life.
(00:27) What was it like 19 years of age, jumping on the live floor? Must have been a bit of a shark tank. Was it? It was terrifying. You know, it really was terrifying. They're out for money, not friends. So, it was very intimidating. You have to have razor sharp razor quick wits and maths. What was your approach and what did you change to become a successful trader in the end? I'm aware of what's going on.
(00:48) I'm aware of the important political events and of course, we've had a lot of that recently with the tariffs. I'm aware of the economics, but I actually don't really bring that into my trading. What do you think is the one kind of myth that traders kind of fall into the same trap time and time again? I learned everything the hard way and and I I certainly learned that that the hard way.
(01:09) You had to have that discipline to do it. And and I didn't always have that discipline. The amount of people that have come to me and said, "I have lost x amount." And the numbers are huge. Staggeringly huge. You know, stop trying to to chase winning trades. Let them come to you. you have to kind of go through the roller coaster ride.
(01:25) It does make it easier when when you're not, you know, when you're not desperate to make money, when you don't have to make money, and when the sums of money that you're playing with are small enough that it it doesn't matter. That's actually when you start trading better. Now, on a screen, you can go buy, enter your stop loss, enter your target, and walk away.

(01:43) You don't even have to be there. Do you try to keep your portfolio small, or what is it you're trading? Where do you see your legacy in the trading world? If I stay here, I know I'm just going to blow another £30,000. Hello and welcome back to B Trading to Bloss Trading to B Trading podcast. And for sure, you know you're going in the right direction.
(02:02) It wasn't as bad as it is now to be honest. But again, that was it. [Music] Hello and welcome back to another episode of Two Bloss Trading. I am delighted to welcome Jason Sen who's a veteran trader and technical analyst with over 35 years experience in the financial markets. He began his career in 1987 at the age of 19 trading options on the floor of the London inter uh international financial futures exchange life.
(02:51) We are delighted to welcome you on to our podcast Jason. Thanks so much. Thank you for having me. Thanks for joining us. So tell me, what was it like 19 years of age, jumping on the life floor? Must have been a bit of a shark tank, was it? Uh yeah, it was pretty crazy. It was terrifying, you know. It really was terrifying. I um remember going down the first day and you know, there's these huge guys shouting and screaming, all the color jackets.
(03:13) It it's an intense atmosphere. Uh and in it's not a welcoming atmosphere. You know, no one's in there saying, "Hey, come in, try and make some money." You know, they're they're out they're out for money, not friends. So it was very intimidating. Sure. Sure. So, tell me a bit about your background.
(03:28) I mean, what got you into trading in the first place? How did you manage to get at 19 onto the floor? You must have been a bit of wi of a whiz or or something to get you in at that early stage. Probably right place, right time. Uh my dad was a trader and actually had um a brokerage account uh with uh he had quite a sizable brokerage account actually with a with a broker and he found out that they were looking for people and I'd been I probably sent out about 50 or 60 CVs to various different banks.
(03:57) I didn't know what I wanted to do. So I was just literally trying to get a job anywhere in the city. Anyway, I was lucky because this broker that my dad traded through offered me a job as a clerk. So I started actually on the floor of the London stock exchange in the in the traded options market. So I straight into derivatives but unfortunately I started in April let me see now April 87 and it was very exciting.
(04:17) I didn't even know that I'd be on the London stock exchange. So I've gone into the office and then an hour later they're like okay come with us and I'm walking onto the floor of the London Stock Exchange which of course I'd only seen on TV. And then but unfortunately about 6 months later we had the October 1987 crash which was amazing to experience but volumes dried up temporarily and it looked like the stock you know there was going to be very little stock market activity and by December I lost my job so I thought that was it. I had like a 9-month career in
(04:43) the city and I thought oh god it's over. What am I going to do? Uh but it actually ended up probably being uh one of the best things that happened to me in my career because I I managed to get a job with um a market making company. So I switched from executing orders for clients to trading my own book.
(05:02) Now it did take me at least two or three years to get to grips with it. Uh that's a bit of a warning for anyone who thinks going to they're going to walk into trading and six months later, you know, be doing really well. Even in an environment where I was living and breathing trading for well, you know, as a full-time job in in in the pit and in an office with traders, constantly learning about trading and options and everything, it still took me at least two or three years to fully understand what I was doing and start to become profitable.
(05:30) And like how do you change is like in terms of how you you you're going to the market, how you approach the market from being in a pit in this kind of crazy atmosphere to like all of a sudden being in an office front of obviously a computer and and and and trading in it in in that same way.

(05:47) Were you using any like I mean what experience did you bring over from the floor to electronic trading? Yeah, good question. At first, uh, the transition was wasn't too bad for me because I went from market making options, uh, on the floor to market making options on screen. Uh, and in some ways it was even it it I could even say it was easier because on the floor you have to have razor sharp razor quick wits and maths.
(06:14) So when you, let's say you buy a call spread on the floor, you're immediately trying to calculate your your gamas and your deltas because you've got to do your your futures hedge. So, you've got to be real quick. Um, and also, you know, you're making your prices. You've got to remember the prices in your mind. You're it's open outcry.
(06:29) If someone comes in and says, "What's the so- and so call spread, you've got to calculate it quickly in your brain. You've got to know all the option prices. You've got to know if the futures have moved a bit, how to adjust the price in your head." Whereas on screen, that was all done for me. All my prices are on the screen.
(06:43) All I've got to do is is monitor the skew and the V. And as soon as um a trade is executed, it's on screen. I know what my delta is. I know how many futures I need to hedge. So, in some ways it was a bit easier than being on the floor. But then I decided to transition to trading futures because trading options, market making options, you you you're never flat.
(07:02) You've always got a position. You've always got risk on. So, even when you go on holiday, you're spending most of your holiday on the phone saying what's going on. Um, and making sure you've got your hedges on. Even even if you've tried to flatten out your position, there's always an element of risk.
(07:15) After doing that for such a long period of time, I decided, you know, I really want to get away from this and be able to to move away from the market when I want to and have an actual break. So, I tried I moved on to trading futures on screen with my own money and that I found impossible. I suppose I quite arrogantly thought if I can run an options book, you know, trading across dozens of different strikes and different months, how hard can it be to trade the bund future? You know, it either goes up or down. And I realized that it was a
(07:43) totally different skill set. I had no idea what I was doing and I very quickly lost about 30,000 pounds which made me realize I better find a different approach. So I I guess what was your approach and what did you change to become a successful trader in the end? Well, I went out and bought a load of books.
(08:01) Some of those I think are still very popular books like Trading in the Zone and uh the um is it Alexander Elder his books. So I just read and read and read. I actually decided to go traveling cuz I thought if I stay here, I know I'm just going to blow another £30,000. Um, which I definitely couldn't afford to do.
(08:17) So, I thought I'll spend a small fraction of that and I'll go traveling, which I'd never done because I started working at 19. So, I went armed with a bag full of books. went went around Asia and and started to educate myself uh about discipline and structuring a trade and um sort of uh trade psychology but most importantly technical analysis.
(08:39) I I realized I had to have a strategy sitting in front of a screen and just looking at the at the order flow which is kind of what you did on the floor. It wasn't enough for screen trading. You you had to find an edge. You had to have a strategy. Uh you have to have a process. That was a very long journey because the thing is we were like the first screen traders if you like.
(09:00) So it wasn't like you could read a book and someone would say, "Oh yeah, you need a process. You need a setup. You need an entry strategy. You need a trade management strategy. You need an exit strategy. You need an account management strategy. You need to risk 1% per trade." You know, all of these things that which we all know now.

(09:16) It's all out there on YouTube and you know, it's it's it's easy for everyone to learn the rules. We kind of made the rules because there weren't any rules and and those rules didn't necessarily apply when you're market on the on the on the floor as I said. So it was a very very steep learning curve. Sure.
(09:33) So you kind of push towards technical analysis and that's what you really focus on at the moment. But how much um outside noise do you take into your charts before you go to your charts? Like how much fundamental or sentiment? Do you know do you build a bias before you go to your chart or you just kind of trading in a format where you're just simply trading on the charts without any noise? Uh I pretty much am a purely technical trader now obviously because I'm you know I'm in the markets and I have been for nearly 40 years. I'm aware of what's
(10:01) going on. I'm aware of the important political events and of course we've had a lot of that recently with the tariffs. I'm aware of the economics. Uh but I actually don't really bring that into my trading. It doesn't it doesn't help me particularly. I'm a short-term trader. I'm not looking at trends over weeks and months.
(10:23) So for me, what happens within a day isn't really affected by fundamentals. Of course, as I speak to you today on on Friday, the 2nd of May, we've got the non-farm payroll number out shortly. So that will obviously affect the the market, and that's something I have to take into account. The dollar, gold, stock markets or whatever, I'm sure will be um solely focused on that P that on that um event.
(10:46) But otherwise, I'm really not um making decisions based on fundamentals. It's purely technicals. I'm a support and resistance trader. I trade in I'm a trend trader. You know, just very basic um technical analysis techniques which I've have found worked over the last 20 years.
(11:03) Similar to myself in terms of I think when it comes like I'm I kind of like to bring a bias into my into my kind of trading before I go to my charts. It gives me an idea of whether I'm I'm more willing to be kind of bullish or or bearish on a market before I even look at a trade. Um but certainly in terms of setup, I try to keep it as simple as possible.
(11:20) I just feel like adding too many indicators into your charts can just skew uh almost like paralysis by by analysis. Um but I mean you've been trading like you said for like three decades now. Like what's the one key pattern or signal that stood the test of time for you do you think? Um I well for me the the key to what I do is definitely trend trading.
(11:42) And I and I learned that I learned everything the hard way and and I I certainly learned that that the hard way. the market would go up and up and up and you'd think, okay, it's gone too far. It's got to come back. So, you're shorting into a rising market or even worse, you're thinking, I want to buy this because it's in a bull trend and then it goes up so much you think, I'm going to sell it.
(11:58) It must be the high of the day or the high of the week or whatever. You're picking tops in a bull trend. Wow. You know, I don't know about you, but it's a very painful learning experience for sure. And of course the thing is even if you do manage to pick the high of the day in a bull trend the pullback probably won't be significant enough to have made it worthwhile because you just don't get you know you don't often get deep pullbacks in in a bull market.
(12:23) So I you know after a very long time I was took me way too long to learn and after losing far too much money I realized you know what if it's going up just buy it. Stick to the trend for sure. And what what do you think is the one kind of myth that traders kind of fall into the same trap time and time again with you know with certain technical analysis? One myth I think for well what I would say is I I would advise people to focus on longer term charts.

(12:48) Most people that come to me are very focused on the short-term charts 5 minute 15inut you know whatever. Uh and that's fine if you if you're scalping and and and it works for you that's fine. You know everyone has their own approach. I don't think anyone has exactly the same approach as another trader.
(13:06) But for me, I I can't do that. I think the signals on shorter term charts are just simply not reliable enough. So, I focus on the 4hour chart where for me, it seems to be the trends on the 4hour chart. The patterns and the candle formations are just that bit more reliable. Sure. And so, you're trading on like a 4hour chart, but you're kind of a short-term trader.
(13:26) So obviously I I assume then you're kind of going down into the lower time frames as well from the 4 hour to try to find those levels within the shorter time frames to kind of not scalp a day trade within. Is that right? Exactly right. Yeah, that's exactly the approach. So I will use the 1 hour chart a lot I guess.
(13:43) Yeah, you're right. What I'm saying is 4hour chart I'll be looking that's where my trend is. That's maybe where my more reliable trend lines are. But you're right, for trade entry, I've I'll be drilling down into the one hour, but not shorter than that, to be honest. I could I'll rely on the moving averages on the one hour chart and, you know, the the the candle formations, and it gives me enough information to, you know, trade find two or three trades in in gold in a day.
(14:06) Sure. So, in terms of you trying to find, let's say, a high probability trade, you essentially look at the the the wider time frames. You're looking at the general trend of the market, and you probably know that anyway because we're looking at the markets every day. We know what, you know, where these trends are going.
(14:20) um you're you're shorting up them time frames to look for your entries obviously looking for the ideal place to put your stop losses outside like recent highs or lows or whatever the case may be you're using moving averages like you say and potentially RSI just to understand you know the where the market is but other than that that's kind of basically your you know core technicals yeah you've just described it as if you're looking at my my tra my my uh my charting screen you you you've nailed it it's it's exactly that movement averages trend lines I use
(14:47) Fibonacci retracements as I say, trading with the trend. Um, yeah, exactly what you've said. I actually use the slow stochcastic instead of the RSI, but they pretty much do the same thing. Sure. Sure. Absolutely. So, you obviously came from the trading floor to the trading desk to now set up your own uh day trade ideas.
(15:08) How did you kind of fall into that? So, I was, as I say, I studied technical analysis. I was getting into it. I actually got a job for a short time. I was living uh after when the floor shut. I wanted to live in the sun. So, we moved down to Gibraltar where you could, you know, have a favorable tax environment and it was just idyllic for me.
(15:26) Go to the beach on the weekends, that kind of thing. Um, uh, and then when I stopped, uh, market making options, I went for for a short period of time, I I did some broking. I I was a der derivatives broker down in Jibralta. I've been studying my technical analysis and some of the clients there, I I told them what I do, and they were like, okay, you know, show me your levels, see how they work.
(15:45) and they were big clients like Deutsche Bank, Morgan Stanley, Bank of America and the levels started to work and I was getting some good experience. So they they would use my levels um for hedging purposes um and it just it just came from there. It worked and when I left the brokerage company they said hey can we pay you for the service? Can you continue to provide the level? So initially I had bank clients and then as they dropped out or you know the the my clients from that a desk left um it was more and more difficult to keep the bank

(16:17) clients. So I I've slowly transition to providing my service to retail traders. Very good. And in terms of that I mean what difference do you see between let's say a retail trader as opposed to maybe more of an institutional trader? You know what is the main difference you see between the two? I would say that the retail well the bank traders would I I think it would be right to say they would wait for the flow to come to them.
(16:41) So you know they were acting as derivatives market makers. Um they weren't necessarily be being proactive and going out there and studying their charts and saying oh let's go out and put on this call spread. I don't think that was the case. I didn't go into it in depth with them. But obviously retail traders um are not sitting there waiting for the business to come to them.
(16:58) They're being proactive. They have to decide when am I going to enter the market? How am I going to decide my entry criteria? How how am I going to manage my risk? How much am I going to risk? It's a far more refined process than working for a bank where you say, "Okay, someone wants to sell us a thousand call spreads.
(17:14) Yeah, we'll take them on. We'll put the hedge on, you know, and wait for the next order." There's a lot a lot more to manage and a lot more decisions to make. I think as a retail trader and obviously I think you feel the risk a lot more because when it's your own money, it's a lot more painful than the money of a bank. 100%.
(17:29) And and do you think there's like a common kind of mental block that holds retail traders back? Yeah, I think there's a lot of mental blocks. Um I think that the first thing that people need to do or they don't do is manage expectations because the problem is with trading unlike pretty much any other job I would imagine there is an unlimited amount of money on the table every minute of every day.
(17:53) You know, even when you go to a casino, you know, okay, I can put a hundred bucks on red. I'm only going to make a hundred bucks. And unless I've got a million bucks on the table, I can't bet that. So there is there is a limit to how much I can make on every bet. When you're sitting in front of a trading screen, it's literally unlimited.
(18:12) I can buy gold at 10 bucks a point. And if it goes far enough, I can make a hundred or a,000 or 10,000 or 100,000. I mean, it's obviously got to go a long way to make 100,000, but you know, there is an unlimited amount of money. So, it can get very exciting very quickly and your expectations can be blown away. You know, people come to me and say, they say, you know, I've got $10,000 and I want to turn it into 50.
(18:33) And I'm like, okay, well, you probably can, but you're not going to do that in three months and and expectations just get completely out of control. Yeah, you get that as well, do you? Yeah, for sure. Yeah, 100%. it. Look, I think there's there's so much um psychological it's a game of psychology in in so many people and people can't take away their mental emotion or their emotions out of their trade and that's the biggest problem I found over the years.
(19:01) It's like if you can just find a way to think objectively, you know, stop trying to to chase the winning trades, let them come to you like this. And I suppose that goes into your own psychology. I'm sure that would have shifted from the life floor to moving to to electronic trading to being kind of a retail trader now yourself.
(19:20) I mean, you you would have seen the shifts yourself. Um, and you have to kind of go through the roller coaster ride during the process of learning how to trade financial markets, but you have to accept you're going to lose trades along the way and and and allow that to be a part of the process. Learn from the trades that you've lost.
(19:39) Understand why you've lost that trade. You might have had the perfect setup. You just might have got something small wrong. You know, you might have just put your stop loss in the wrong place or you've just not analyzed analyzing your losing trades actually gives you more value than analyzing my winning trades. And and that's the key.

(19:52) And how do how did you how do you find, you know, especially in a volatile market, how do you control your mental emotion? Yeah, those are all actually really important points. Um, you do learn way more from your losing trades. You do have to look at them as lessons, but I'm sure as you've encountered from what you do, when people start, they think they don't need us to use a stop loss.
(20:13) They think they're going to be able to control the losses themselves. And they just don't. It's frightening the amount of people have come to me and said, "I have lost X amount." And the numbers are huge, staggeringly huge, the hole that people get themselves in. And of course, once you've got yourself into a hole where you've already lost more money than you're comfortable with, you're then desperate to get it back.
(20:33) And that usually leads to more horrendous losses. So if anyone's watching this, please please please just don't do that. They say uh learn to love your losses, don't they? And that doesn't mean, hey, great. I can't wait to make them make a loss. It means I've made a loss. Let's keep it under control, cut it quickly, move on to the next trade where hopefully I'll make a profit, but if I make a loss, it will be another small one.
(20:56) I can handle it and eventually I'll get on a winning streak or I'll certainly get a winning trade that will hopefully do a do a two or three R and get that money back. Um it's life is so much easier when you take take your loss when you know you need to get out and and you just set your stop loss when you enter the trade.
(21:13) Set your stop loss. You know on the on the trading floor we we didn't have automatic stop losses. You had to execute them yourself. You had to have that discipline to do it and and I didn't always have that discipline. Now on a screen, you can go buy, enter your stop loss, enter your target, and walk away. You don't even have to be there.
(21:30) Walk the dog, go to the gym, let the trade play out, plan the trade, and if it doesn't work, okay, I've lost half a percent, 1%, doesn't matter. I'm not emotionally impacted. I can move on to the next trade with confidence. You know, it's just basic, but as humans, we seem to struggle to do it.
(21:49) I've mastered it now, but it did take me a long time. Yeah, for sure. For sure. And I suppose it seems like a simple thing for people to understand like you can't trade unless you're going to accept losses along the way once you minimize them losses. But it's a s it's a real basic principle but it's something that people just can't accept.
(22:07) And it's just that psych psychological edge. And we talk about edges in trading. It's not just having a strategy that you can find an entry on a chart. That edge is also being able to accept the losses. understanding, you know, when to let a trade run, when to when to cut it, when to bring your stop loss up, when to use a trading stop, when to scale into a trade, all these things, you know, when we're talking about people say to me, "Oh, well, I'm looking for this trading edge.
(22:30) " And I'm like, "Well, what do you think a trading edge is?" You know, what do you believe that that is? Do you think that's kind of a miracle technical um indicator that's going to tell you when to buy or sell? Like, nobody has a crystal ball that's going to going to like it doesn't matter. Look, you've been trading for 35 years. I've been trading for nearly 17 years.
(22:48) There is no crystal ball. You know, all we're doing is trying to stack the odds in our favor. Simple as that. And in terms of I suppose for kind of trading a few different asset classes, do you try to keep your portfolio small or what is it you're trading? Yeah. Do you know what all of those points really are so important? Um, okay.
(23:08) So to answer your question, I I well I provide a service to my subscribers where I go out and try and find trade ideas. So that covers gold, silver, oil and then covers the forex markets and the US stock indices. So I could be looking at 25 30 markets in a day trying to cherrypick what I see as the best opportunities. So I I very clearly understand my entry strategy.

(23:30) Um should do, shouldn't I, after all these years. Um, so yeah, I mean I cover way more markets than anyone should. Uh, it's just the way my system works. And I might pick 15 trades in a day, but I'm I do that in the morning. So I do my analysis for an hour or two and okay, I'm looking at a trend.
(23:50) Yes, I've got a bull trend here. I've got a support level here because it m you know there's an area of confluence with Fibonacci level, a trend line, a moving average, that kind of thing. Right? I'll put it in I'll put it down as a trade opportunity. We may never get there. The market may may never hit that. In fact, I'd say probably only 30% of my trade ideas ever get executed.
(24:11) Uh like you said earlier, no crystal ball. I have no idea what's going to happen today. I have no idea where the markets are going to go. I'll have a bias, but I'm prepared to I'm happy to, you know, prepared to be wrong. My my subscribers will say to me, "Oh, you know, I'm long gold. What do you think?" And I just say, "I haven't got a clue.
(24:28) " And anyone who tells you that they haven't got have that they know where gold is going is is lying or they're just giving you their opinion. And it's just you can't trade like that. You can't trade on guessing direction. 100%. And that's the beauty of kind of technical analysis as well. It's kind of like yes, we can identify these, you know, uh trends and we can identify key indicators and to give us an idea, but nobody knows where gold's going to go right now.
(24:52) I mean again especially in a market where one tweet or one comment from from Donald Trump is going to blow up the markets I've spoke spoke about this before but in terms of like you know those correlated markets and I'd like to know your opinion on this whereas there were so many correlations we knew like you know okay the safe where the safe havens are flows are we know okay if something happen stocks are going up we know where dollar's going if gold's coming down we know you know all the different correlations and they they seem to have
(25:18) kind of dissipated with all the market noise that's going on at the moment. How have you adapted your trading since Trump's coming to power? Okay. Yeah, that's a really good point. I'm a lot more cautious obviously. I mean, there's never been a more important time to have that stop loss in place because like you say, one tweet or a quick comment from him and all hell breaks loose.
(25:40) So, you you have to make sure that your downside is constantly protected. It's interesting that you said that as well, the correlations because when Trump when the whole tariff thing first kicked off, stock markets collapsed, dollar collapsed and gold actually collapsed and that was a weird correlation. Gold, shouldn't that be going up as a safe haven? You know, flight to quality and of course the bond markets did go up, which is what they should have done.
(26:02) Uh, but I've seen that before when stock markets when all hell breaks loose and there's no understanding of what's going on. Gold does often do that. it initially goes down and I think that's margin calls uh people liquidating something in order to meet margin calls maybe in the stocks or whatever because then gold turned around and obviously went through the roof I think it went to it's been to 3500 now hasn't it and and that was a staggering 600 point dollar rally from the 2900 area when it when it initially collapsed. So yeah, the correlations,
(26:36) you're right, they did get blown out and you just have to be really really careful. You just anything can happen for sure. 100%. So you say that you trade so many markets. You're up every morning. You're doing this. You've published over I think 6,500 articles. How do you stay inspired and avoid burnout? Do you enjoy doing what you do right now? Wow, good question.
(26:56) I've not been asked that before and it's and you you've you've nailed it because uh I'll be honest, I've actually I don't trade much anymore. I've actually lost interest in the actual sitting there executing trades, watching them all day long. Uh I'm lucky. I mean, after being in the markets for so long, I I should have really made enough money that I don't have to do it anymore.

(27:18) Otherwise, I'd be a bit of a failure. Um so I can pick and choose when and if I want to trade. And actually to be honest, you know, even with my experience, you can still have biases. If so, if I don't have positions on and I'm not actually trading myself, I find I'm a little bit I'm that bit more open-minded, less biased, which is better for the service and better for the analysis if you're purely just looking from an objective point of view.
(27:45) Um, so yeah, but when I do trade, I I keep it really small. It's play money really. Um, uh, I I just don't get too involved anymore. So, and it does make it easier when when you're not, you know, when you're not desperate to make money, when you don't have to make money, and when the sums of money that you're playing with are small enough that it it doesn't matter.
(28:03) That's actually when you start trading better. Yeah, I I agree 100%. And I suppose like what would you say is the proudest moment of your trading career? You've had quite a journey over the last 35 years. You know, what do you think has been the pinnacle of that? And I suppose where do you see your legacy in the trading world? Um I'm actually really well now I'm really enjoying tra train training people because I really understand so much about train trading and because I've trained so many people um it sounds a bit corny oh you know I
(28:36) want to give back and uh people say oh you know if you're if you're teaching you're obviously no good otherwise you would actually be trading but you it is genuinely rewarding because when you're teaching people you're building up relationships so a lot of my students have become friends and we you And it is great to it is really rewarding to have someone come along.
(28:55) I'll give you an example. Someone came along to me the end of last year, nice guy, uh footballer, and he had a tremendous strategy. A strategy that can return six, seven, sometimes eight R, but he just had no control over himself. And it was a real challenge for me because normally I uh I I have some tweaks and some hacks that I can give people on.
(29:17) They can turn it around quite quickly. this guy would do really well and then he you know typically blow it all and you know and I and I really like this guy. We we we become good friends. We talk quite often and I'm that for me recently is is a proudest moment because he's turned it round and he is now consistently profitable and doing really really well and and it's um it's it's very satisfying for me to see that.
(29:38) Sure. 100%. I think look this industry is is full of um people that have no interest in the the people are trying to teach or there's there's look just the industry as a whole unfortunately has come down this Instagram route of everybody trying to portray a lifestyle or so on.
(29:56) It's just great to have people on our podcast that have the same uh you know ethos that that that we have here and genu genuinely trying to help people in the financial markets like we we are here to try and help you know and give good information and give the best opportunity and and at the end of the day all we can do as educators and and and mentors and so on is try to put people on the right path.
(30:20) It's then up to the people themselves to be able to take that on board and take it seriously. For sure. Yeah, it actually um and and you brought up a point earlier where I talked about expectations and it was really teaching this guy that made me really think deeply about expectations because he came to me.
(30:42) He said, "I've got um I don't know, I can't remember the numbers exactly, but let's say he said I've got €10,000 in an account and I want to turn it into €25,000." That was you know we talked about this earlier and I said okay we can do that in three or four months. It's it's not unrealistic with the strategy that you have because you can get six seven R out of a trade.
(30:58) What I realized the problem was is he wasn't thinking I want to get get to 25 grand in three or four months every day. He was he had that number in his head and that was what he was working towards every day. So his risks were were out of control. And once I said to him listen baby steps. Let's try to get to €12,000 within the next 3 weeks, you know, four weeks.

(31:22) If you can get 20% return, which is possible on your strategy and realistic, then we can try to get to 15 and then 18. And you know, when he started doing that, then he he is on the path to getting to where he wanted to go. So just simple things like that, it was literally just about changing perspectives and managing expectations and it and it worked a dream. Sure.
(31:41) I mean it's it's quite incredible that um when we look at some of the best hedge funds in the world and they're producing maybe 15% annually on on on a on on you know returns whereas retail traders if they get it right if they if they really find something that works for them and they have the right strategy like returns are incredible.
(32:02) You just need to be able to manage your risk along the way and that's that's just absolute key. and and tell me if you had if you could tattoo let's say one trading mindset principle on every person's arm that you've ever done mentorship or spoke to. What do you think that one uh one strategy or one you know one point would be? Uh it's very simple.
(32:25) When you enter a trade, place your stop-loss. It's that simple. This is this I think this is the biggest failure point for most people. they just can't bring themselves to put a stop loss in because what they're doing when they do that when they enter a trade and put a stop loss in they're immediately admitting to themselves that this trade might lose money and they don't want to admit that to themselves. Sure.
(32:45) And do you think like is there a correlation between the people you teach or mentor? Is there a specific profile of person do you think does better in trading or do you think it can be anybody from any walk of life from any background? I think it can be from any background. Yeah, for sure. Um, and the good thing about these days is that with prop firm challenges and all that and that market's become a bit more developed now.
(33:11) I think it was a bit scammy at first, but I think it's become a bit more developed and and the companies that are surviving now are taking it a bit more seriously. Um, so with tools like that, yeah, anyone with a hundred bucks can can get funded if if they're disciplined enough. So the opportunities are there for everybody.
(33:28) Um, I think the people that come to me are those that have tried it. I think every, you know, so many people try trading and they end up in two groups. They try it, they weren't serious enough. They screwed up. They realize this is too much for me. I can't do it. And they quit. And then others go, "Okay, I've screwed up.
(33:44) I've lost money, but I know I can do this, and I'm really determined." Those are the kind of people that come to me, and they they know, I guess they know what they don't know, or they know what they need to do, and then they need someone. They want someone to fix it. For sure. I think the one if I could say there's one core element that I have seen through people who have gone on to be successful in trading is resilience.
(34:06) Uh it's and and controlling their emotion. I think they're the two things. If you can control your emotion, be resilient and take as much information as you can on board and and treat this like a job. Even if it's a part-time, you take a couple of trades in the morning or the evening, you have to treat it like a job.
(34:23) you have to treat it with it in a having a professional approach to to to what you're doing uh if you want to succeed in this industry for sure. Um so Jason, it's been an absolute pleasure having you on today. Um yeah, it really has and you know getting people like yourself onto our onto our podcast with the backgrounds that you guys have with the knowledge that you have and all the experience you've built up over the years.
(34:49) If someone can take away one thing out of this podcast, it's definitely uh something that we want to do for our listeners. So, thank you so much again. Thank you. Been great fun. Great questions. Really appreciate it. No problem. It's a pleasure. Take care. Cheers. Bye-bye.
Rogue Trader Podcast - E015 - Markets in Chaos: Gold, Bitcoin, Tesla & Nvidia | ft. Jason Sen - YouTube
https://www.youtube.com/watch?v=QArRvhPtWXI

Transcript:
(00:02) [Music] So, welcome back to the Road Trader podcast with me, Nick Gleon. Um, today we're talking markets and we have uh the expert Jason Sen with us. I think over the last week or so we saw um markets trading within a range for a period of time. Um and then Donald Trump, as is his want at the moment, kind of scuffled all of that, announced some tar tariffs on the EU and the markets uh collapsed very quickly late last week.
(00:34) At the weekend, he's announced or they've started to have discussions with Ursa Vonda and um these have been described as aggressive talks or you know uh positive talks in in terms of addressing those tariffs. So there's now a delay on those tariffs to the 9th of July, I think it is, and the markets have boomed back higher.
(01:00) So there is no consistency uh in in terms of what Mr. Trump is doing. There's no consistency to the market. We're still getting whipped around um from day to day and a lot of that is depending on the comments coming from there. Um issues with the Treasury yields as well. The 10-year Treasury yield is all over the place. Um, but we want to touch on four different markets today.
(01:22) We've been following gold as a bit of a theme. So, we'll go back to that. I think last time we spoke, which was about seven, seven, eight days ago, Jason, uh, we were looking at Bitcoin. You called that higher, the trend resuming. I think we got fairly close to about 112,000 and then that fell away with the Trump announcement of of the tariffs.
(01:45) I think Tesla looking at Tesla yesterday was up 6%. Um, so we spoke about that death cross and the JP Morgan uh announcement a good few weeks ago. Now that was probably six or seven weeks ago when Tesla was trading down to 190 significantly higher now. I wanted to talk to you about maybe where you would have got out of that trade because you were a buyer at the 190 191 level and then because it's results season and one of the magnificent seven is is reporting later today Nvidia just wanted to get your thoughts on that.
(02:19) Um but if we start with gold if you don't mind if that's okay. Um I think last time we spoke it was a bit of a tricky market trading in a range and there was no clear direction uh at that particular point. Correct. Yeah. Always tricky. Right. Here we go. Let's have a look at gold. Okay. So, um it's all down to the bull flag.
(02:44) Uh I've been talking about this bull flag pattern for a little while. Uh it's been forming it's over a month now. It looks like it's about six five six weeks old. This pattern, a bull flag is a typical pattern in a bull trend. It's just a consolidation. The the flag is um is is uh defined by the trend lines, the upper and lower trend line.
(03:03) So, the idea is this is the flag pole here. There's the flag. Now, the problem is you don't know when it's going to break out of the flag. So, yesterday I was actually getting short up here around the trend line uh as as you would do in the pattern. It looks like the moving I'm looking at the 4hour chart now. It looks like the moving averages on the 4hour chart have acted as support.
(03:21) Whether that will now trigger a break above the trend line, it could do. The trend line's at around 3345, right? So, we start getting up through 3350. I would assume that the bull trend has resumed. This is this is a continuation pattern. It's a consolidation pattern, which means that you would expect gold to break up and then continue the move higher.
(03:40) Um, but but you don't know when we may uh we may reject the trend line again. We may even come all the way down to the lower trend line which is around 30. Well, it would be around the 3,000 area if we were to extend the whole move to the downside. Of course, at the moment it looks unlikely, but hey, with markets you never know, do you? No, I mean that would be a big move back down to the 30 uh level.

(04:07) Um, so I mean gold today, I mean yesterday there was a bit of support around the 3290 level. I think it was um something similar again today which is where you're seeing those moving averages at the moment and uh and picking up off of those. Exactly. Yeah, you got that right. Yeah, all of these moving averages have converged.
(04:26) That's a 100 to 200 and the 50 on the 4hour chart all converging to clearly offer a good support level. So yeah, you're right. That would be the key level on the downside now. Okay. Um so if we have a quick look at Bitcoin when we were talking last time you were expecting it to resume its upward trend. We we spoke many weeks ago when uh when when Bitcoin was falling back down and was was approaching that 70 74 75,000 level somewhere around there.
(04:54) Um but it did trade back all the way and it and it was an aggressive very fastm moving market last week. um traded very quickly back up above or well to new record highs. Um touched 111 virtually 112 and and then as I said fell back away with uh with the tariff announcement on Thursday, I think it was last week. Yeah, no question that Bitcoin's in a bull trend, of course.
(05:21) But yeah, pretty choppy lately. Not easy to read, not easy to trade, I don't think. Not for me anyway. But this is where we are. Um, we retested the all-time high, which was just above 109,000, $1 109 and $71. Um, now it's this trend line up here, as you can see, Nick, that is holding it. Uh, joining of the last two peaks.
(05:42) Um, and it really is holding it incredibly well. I didn't think it would actually. I thought we'd burst through it, but we've beaten 109 uh 109,000, but we've only got to just short of 112,000. And the trend, it's all about the trend line. So, you'd expect more resistance up around those levels, but anything could happen from if it gets up there to test.
(06:02) Um, what I would say is if you want if you want Bitcoin to go up, you need to see it through 112,000. You know, clearly that's the level to beat. If we come back down, as you can see, I've got a fib level around 103. Uh, we've got some congestion there from the price action as well.
(06:20) So, that could be a good support level in the short term. Okay. Um then the next one Tesla if you don't mind Tesla was up 6% yesterday. So um when we were talking about that death cross um weeks ago and I think it was a piece of JP Morgan research at the time and you and I both spoke about you know sometimes when JP Morgan or one of those bigger players was coming into the pitch years ago you kind of step aside.
(06:44) You were a buyer at that level around 190 191 it might have been a little bit higher than that. I suppose one of the questions on which which I think was a fantastic call. Um, one of the questions I suppose I have for you, you know, looking back at that and maybe you could talk about where your exit would have been because um, you know, we're now significantly higher.
(07:09) Would you have been holding it all of that way through or were there exit points for you along the way? Um, well, I'm in this for the long term. I It was actually in the low 220s where I was buying it. We didn't quite get down to 190, I don't think, but low 220s and I I've been buying it on the way up. Um, I suppose this is probably another little bull flag pattern here that where I've got my cursor in between the 200 uh just up to the 200 day moving average.
(07:34) Once we got through the 200, we really burst up. We're now through the 100 day moving average and bursting up. Another consolidation phase here, which is probably a bull flag and we've just burst up through there. So, you know, we are recovering very very quickly and there's no reason for this not to continue.
(07:54) I think that we could easily well the 385 would be the next target which isn't that far away. Just over $20. Um, we may pause around there. There is a bit of congestion, but yeah, I think we're going to get there. Put it that way. Okay. So, that's a hold for you and continuing to accumulate, I suppose, along the way as you're happy. Uh, yep, I have. I'm holding it.

(08:15) All right. The uh the the next one which is which I I imagine is a bit trickier, but you're just you're just going to focus on the charts and the and what the charts is telling you in in terms of the technical analysis, but that's Nvidia. So Nvidia are reporting later today. I think it's after the bell.
(08:35) It's probably been, you know, the biggest mover in this stock market over or or in the US stock market over the last two two and a half years. is I think it's up 1,500% or something over that period. It's a it's a crazy number anyway. They always, you know, in uh most of the reporting or earnings and uh and business reporting that they've done over the last couple of years, they always exceed expectations.
(09:03) Um I imagine that there's a lot of sentiment in the way that it trades. There'll be a lot of people looking at this and how it reacts today and it has a bigger impact on the market. um it's more widely used within the indices as well now. So just your views, targets, what you think may happen within video. I know it's a difficult call especially with what's ahead today, but um very current. Yeah.
(09:26) Yeah. I wouldn't like to call the number myself. The one this is really key and it's a big pattern. So this isn't going to have a short-term effect, but a head and shoulders pattern is something that indicates a reversal in the price. And this is not a completed head and shoulders pattern.
(09:42) So I'm not saying that Nvidia is going down. But if you are seriously involved in Nvidia, if you're an investor, it's worth noting. This is a typical head and shoulders pattern. So we've got um left shoulder here. We've got the head. We've got the right shoulder. I don't know if you can see that, Nick. You probably know what a head shoulders pattern is anyway.
(10:01) Um so we would have to break the neckline, which is all the way down $85. So, you're talking about a $50 drop before you even um Hang on. Excuse me. Someone's messaging me. I just want to shut that down. It's probably the CEO of Nvidia wanting to know what you think. Yeah, maybe. Right. Apologies for that. Let's go back.
(10:25) So, you would need to see Nvidia drop $50 before the pattern is even complete. So, we're a long way off. the chances of the pattern forming are very low indeed, but I just want to make people aware because that would be very significant. Anyway, for now, um we are approaching well the all-time highs really, aren't we? This would be key this trend line here uh 153.
(10:47) We we we're sort of in the upper upper area of of the recent consolidation. You know, I'm just going to do a rough trend line. This is roughly the middle of it, isn't it? where maybe it's a little bit above where the 100 day moving average is the blue line. So, we're in the upper portion of the recent range, which I guess is quite bullish, but it's kind of no man's land really.
(11:09) If you said to me, you know, where are we going up or down, I really wouldn't know. We we're just consolidating and moving sideways. So, we we'd either have to get down below 120 for me to be a little bit more negative in the short term at least. Um otherwise, we could push up and retest the highs on a good number, of course. And then 153.
(11:28) Yeah, that's the number to look for on the top side. Okay. Well, look, there's I mean there's every chance there's going to be a good number because that seems to be with the trend uh the trend with Nvidia's numbers over the last uh over the last number of quarters. I think sentiment is improving as well.
(11:45) I think that's um you know, one of my observations. Um the markets are back trading above or slightly slightly above the liberation day levels that we were trading at. It's crazy. Yeah. when you think of all the damage that was done with that announcement and the uh and the volatility that spiked around that sort of period, it's all gone.
(12:04) Some people are saying that tariffs aren't having the impact that they did, but I I think the EU announcement last Thursday suggests that there, you know, there's still a lot of damage that can be done with these announcements. The I I I think for me it's just the lack of consistency.

(12:23) how you go from Thursday to Sunday from having a 50% tariff to delaying that and everything's back to normal and we'll all forget about it. It is just weird. But those are those are the conditions that people have to trade at the moment. So I'm sure you're you're you getting levels that are triggering left, right, and center and uh reversing fairly quickly when you see days like that as well.
(12:43) So it's very very difficult. Yeah, it's tough. I'm I've been focused on the dollar. We had a a bare pattern on the dollar. It looked like dollar was going to sink. I was short. looking great yesterday. Huge jump in the dollar. So, yeah, it's really jittery at the moment. It's hard to predict. Yeah. All right. Well, Jason, look, thank you very much for joining us again today.
(13:02) We'll all be uh we'll all be looking in on Nvidia, see what happens with Tesla over the next period and see if Bitcoin can go up and uh and test those record levels yet again. Um, if you you are enjoying the content, which I know many of you are, please continue to subscribe and like. Uh, and we will be back talking to Jason again very very soon.
(13:24) Thank you very much for joining us. Thanks so much. Good luck with your trading, Nick. Cheers, mate. All right, mate. Take care. [Music]

Expert Trader: Is It Impossible To Predict Market Movements? - YouTube
https://www.youtube.com/watch?v=fRCm15KZlfw

Transcript:
(00:00) I made a million pounds in 4 days that was 1992 I was in the thick of the of the short Sterling pit the UK Chancellor thought it'd be a great idea to Peg the pound to the D mark So their economy was was growing our economy was shrinking the interest rates kept creeping up and eventually they got to 15% they had to force the pound to stay in this range with the deuts Mark I was making like 250 Grand a day I was only like 23 it was crazy I had a backer who gave me unlimited money so it was just so much volume if you knew what you were doing it was almost easy it was
(00:32) like free money I was constantly swinging the backat looking for five six figure sums so it's pretty crazy yeah I made for a million pounds in 4 days you what your thoughts with patterns cuz one thing people say in terms of patterns is the patterns always the same and it can't be that easy and they're too easily recognizable that's someone who uses patterns in your analysis how long have you been doing that has there been longevity in there good question uh [Music] the number one podcast in the trading space the fastest growing and that's thanks to every single
(01:08) one of [Music] you profitable trading really boils down to two things opportunity and volatility and that is why the podcast has partnered with Market Journal because between the years 2016 and 2020 the amount of opportunity that was available as well as volatility to take advantage of was at the highest has ever been and all of that really pointed towards one man president Donald Trump during his period in office all it took was one tweet and that would present so much volatility and the right Traders would take advantage of that and would create their record pnls and
(01:44) that is why those same Traders are so excited for this new period between 2025 to 2029 when we have President Donald Trump back in office now Market Journal is going to give you the weekly insights you need across crypto Forex futures and the stock market so regardless of what happens whether it's a tweet a particular stock running up hundreds of percent whatever volatility and opportunity that market Journal can identify it is going to share with you every single week so you can purely focus

(02:14) on taking advantage of those opportunities and taking advantage of that volatility to create your record p&l now Market Journal is absolutely free all you do is click the link in the description below put in your email and you will receive key updates on the markets every every single week so you are always up to date with what's going on and ready to execute when the time is right links in the description below thank you for enjoying this episode let's take a break for a minute there
(02:42) guys cuz I want to let you know about one of our sponsors Alpha Futures is offering the best onstep evaluations in the industry and in the month of December they have no activation fees they have the largest endof Day based draw Downs in the entire industry with up to 90% profit split and lightning fast payout speeds and offering Advanced and standard accounts to fit your needs Alpha Futures is truly offering the most elite plans for the lowest total cost to entry in the industry you can start as low as $79 and thanks to the podcast using Code RZ RZ you can get 20% off any of those
(03:21) challenges go to the link in the description below and let's get back to the episode welcome everyone to the words of rydom podcast we are back once again and still the number one trading podcast in the world and the fastest growing thanks to all of you and our incredible guests make sure you hit subscribe and hit like right now because we're bringing you the very best traders in the world talking of which today we have a Trader who has a career spanning over 37 years so far and still going which is very important and still going uh he started off at age 19 on the London
(03:51) Stock Exchange trading options shortly after that going to the London International International final Financial futes exchange the life Flo thank you I needed the help but as you can see we're here with Jason S thank you for being here man pleasure thank you so much for inviting me it's my Absolut pleasure I know we've been talking for a little bit of time um because I know you don't you know preside in the UK at the moment so we had to wait until you were here which I'm very happy for I've traveled 6,000 miles just for this I I would love to know that was true but
(04:23) I know it's not know it's not but I'll take the honor anyway but one thing I want to ask you off the bat normally you would go straight into your Journey but something that's really stands out to me is like a lot of Traders have short careers a lot of people they can't handle the markets for a long period of time but you are 37 years in and still going what is it about trading that or what is it about your passion for trading that allows you to keep trading even at this after such a long
(04:48) career good question uh I mean I think everyone who's involved in financial markets will admit there is a bit of an addiction um I can't imagine getting up in the morning and not knowing where gold where's the dollar where's the Yen you know it would just be weird to me so I I don't trade actively that much anymore I'm I'm actually trying to stop myself trading because I'm trying to reduce stress in my life and become semi-retired um but I love uh analyzing the markets and sending out my signals and stuff to my subscribers I don't think I could not do that so it do you think
(05:24) it's the understanding of what's happening in the markets and that generally cuz one thing I find F about the markets is like once you understand what's happening in the markets as a byproduct you end up understanding what's really going on generally in the world as well as a whole and I think that's one of the major benefits is even if you're not a Trader as long as you understand those charts and you understand them what's going on globally a lot of what we were just talking about before we went on there in terms of like the emotions in the news and emotions in politics Etc

(05:52) kind of gets simmered down because you understand more so okay what's actually happening why is the cost of living so high why is you know the the impact of say immigration happening on the economy and so on so therefore it just really simmers down because you have a greater understanding than just the average person who doesn't really understand the markets at all that's actually a really good point I suppose for people who don't trade they probably can't imagine going through the week without following the news switching on the news you know whatever on your phone
(06:20) so for me it's financial news and and you're right it does have a bearing on the economy and geopolitics and everything else so um yeah I can't imagine not knowing where inflation's going or or what inflation is at least that kind of thing what was it about trading that first got your interest because you started very very young like you were on the stock exchange in 19 so I'm guessing the interest might have started slightly before that at least but what was it that first sort of peaked your interest with trading uh money I was a teenager I wanted to you know go out and
(06:48) get a good job and earn some money and buy a nice car um my dad was actually probably one of the original like at home day Traders oh really so he would he actually got an office and it was really weird because he had an office and he had a desk bit you know bit like this a phone and that was it because of course there was no laptop in those days no cell phone um and then he on the wall he'd have graph paper and he he traded the footsie so he'd have he'd have a line chart at first um and
(07:16) then he heard about bar charts so he'd have a bar chart and he'd literally put a line on there every day and so he had this footsy chart on the wall so you know i' go and see him after school i' like you know what's going on Dad and he and then he would just sit there I think I think there was some sort of Oracle thing that where you could get prices that were delayed but usually you'd have to pick up the phone say hi right where's the footsie now and you put your order through on the
(07:37) phone so is obviously very primitive but that was how what interested me and then I remember once he made like a big sum of money so obviously that was amazing I mean he lost big sums of money as well don't think he ever really made any money but he loved it and that's probably where my my passion came from I can imagine actually I can imagine it's very unique story cuz a lot of people they don't have that direct reference it might be someone they know or especially nowadays it's more Social Media stuff but especially back then to have that direct sort of inside the household
(08:07) reference is incredible especially being able to sort of question and see the charts as it well the homemade charts yeah um in comparison to the today and I think I love this is why I love having Traders such as yourself on because it's especially if you've traded throughout the eras as well in terms of from that seeing the progression of technology and how trading itself has changed and how accessible it's become versus what it used to be U but interesting thing you said there in terms of he made some money but lost a lot of money and in the end probably didn't make
(08:37) so much money from your experience and and from your career so far is that something that you've seen a pattern of like a lot of Traders find themselves in that position yeah I think most people lose money um and I'm not saying I find it easy I absolutely don't um and I still make silly mistakes I still you know I can teach anyone how to trade I know all the tricks and all the hacks and what you should do and and how to control your psychology and or you know trade management account management and I know all the I've got really good technical analysis techniques but
(09:07) am I the perfect Trader no absolutely not I'm just human and I do stupid things and I get greedy and I run positions too long and sometimes I don't use a stock loss so um I'm not the robot that I should be have you met anyone in your career who has been that robot oh that's a good question I I have met phenomenally successful traders who just can sit down and pull huge sums of money out of the market um in fact

one of my very very close friends who is my son's Godfather he was one of those guys doesn't trade anymore and I I I sat next to him in the office I I I traded
(09:46) options and he traded Futures so it was it was a different skill set and he but he would trade four or five different markets at the same time and he'd be spreading one off against the other and and I kind of was get this is probably 25 years 20 25 years ago I was like getting really B down trading options and I said oh I want to trade Futures and he said well come sit next to me I'll teach you I hadn't got a clue what he was doing so it's really quite incredible we came from the life
(10:08) floor we were both sitting in the same office both trading derivatives and yet I literally couldn't understand what he was doing what do you think it was about those phenomenal Traders though was there anything that if you were to look at them anything that correlated to their success I think they just had a six sense about the markets phenomenal discipline that for sure yeah this guy this particular guy that I'm thinking of he would trade big size um you know he could be up up or down a five figure sum in seconds minutes but he would cut so quickly if it was going wrong he just
(10:44) didn't waste time on a losing position bang out next opportunity I think that's probably yeah yeah super disciplined you think that tolerance to risk as well makes a big difference yeah but he I I I suppose what it was is he trusted himself to cut you know he wouldn't be like oh 5 minutes later or you know 3 hours later going go I've still got this position on what shall I do he just he would be bang out so that's interesting because there was a podcast guest I had on Dr Chris caffy and his main thing was in regards to trade ideas like generating new ideas constantly
(11:19) having a flow of ideas for that one of those purposes being that so that when you either take a loss or cut a trade you have the next idea to flow on to um not so that you're overtrading but just literally that you have ideas that are ready to act on should they be in the optimal position to be in it sounds like a very similar thing so like he was ready to not get at tied to one idea because that's the only idea he has realizes that one's not working out cut move on to the next one yeah I'm I'm I'm actually talking about the floor days here so he was a market maker in the pit and
(11:51) and so he was more of a scalper anyway uh he was a Futures Trader so you know he would be there um I'll start doing hand signals now cuz it's just a natural thing to do but he would be you know he'd buy a thousand Futures and then um if he took half a tick or a tick on them he'd be happy because instantly made like $10,000 yeah so um uh so he yeah he was trading very big for small margins um but it's just so interesting how it's a different time you know see how that I was talking about a different one but I thankfully I've been able to interview people as we just said before we
(12:24) started who had been in the pits I got a greater Insight than I probably would have if I had come here without interviewing them because it's so interesting as you say like that it was a whole different Edge in itself in the pits right like the The Edge was more so inside that room inside that pit correct because you would be how how this person described it was like the order flow you people look at orderflow now with the level two charts essentially the orderflow was just in the room then because all the orders would flow through that pit yeah it was a very uh you had to
(12:55) be in tune with your senses so yeah it was visual it was audible you know you you if you were if you wanted to you could just stare around the room and try and spot Brokers on the phone who were looking at their guys in the pit and they'd be saying you know what's the size oh it's four five okay we'll sell a th at four and then I think I think I didn't really do that so much but some Traders would actually look for those orders coming in um and then you you know obviously levels of noise would surge when say there was unemployment number coming out I mean that was really exciting

(13:24) imagine Friday first Friday of the month 1:30 p.m. and there's like it's a it's a big big moment and and then everyone go sh like 30 seconds before sh and then people would start stamping their feet and then bang the Bell Rings number comes out and then all hell breaks loose chaos absolute chaos and yeah that was very exciting to be able to live in that environment I can imagine yeah and do you feel like in one Essence Traders just trading alone in today's day and age like especially they
(13:54) come across it probably online no interaction with a lot of other Traders they don't really know many other traders in comparison to those days where everyone's that that environment and almost that it's kind of a sense of community even if everyone was a friend oh no it was a big sense of community and I I was thinking about this recently yeah you're absolutely right anyone can be a Trader now in those days you had to go to the floor or whatever um anyone with $100 can open a trading
(14:19) account and being a Trader instantly um but it is lonely you're right trying to find and and this is something I try to do I try to bring people together in fact I'm arranging a meeting on Sunday for my followers and my subscribers just to all meet up um and just talk usually at these meetings they come to meet me but they all end up talking um so it's a really good event but um sorry what was I going to say yes so on the floor you're totally immersed in financial markets you know because obviously you are talking to people did you buy any of those you know you know your
(14:47) long Vol or your short V where do you think the Market's going what do you think the unemployment number you go out for lunch with the Traders you're down the pub with the traders in the evening so you're totally immersed in financial markets when you first steep foot on the floor like those very very very early days like those first few days how did you take to it was it something that you were drawn to straight away I was terrified um well when I was 19 and I got my first job I it was with a brokerage company and I didn't know what was happening they said okay
(15:16) turn up on whatever it was Monday at 9:00 so I'm in there in my brand new pinstriped suit I didn't know what I was going to do the next thing they go right come with us and we're leaving the building I was like oh where are we going walk across London Bridge and the next thing I'm on the stock exchange floor and I don't seen that on TV I was like Wow wait till I tell my dad I'm on the stock exchange floor I couldn't believe it so then I was there every day in a it was called the London traded option Market it was a very early um derivatives Market which was just trading
(15:43) stock options anyway 1987 the year that I started six months later stock market crash volumes dried up I lost my job and then I got taken on by a market making company still on the elom on the stock exchange but eventually I progressed to life uh London International Financial FES exchange and that was a completely different atmosphere it was really um intense very aggressive um very loud and even though I'd been in financial markets for two or three years it was a whole new experience and I
(16:14) was absolutely terrified um I didn't know how I was going to do it they they they were far more into the hand signals and it was um a lot more people in the pits it was very noisy and I thought I just thought how am I going to learn these hand signals they were so quick um and eventually obviously I did it it was it I I transitioned a lot I mean you know there was lots of transition periods for me because you know how technology developed yeah I can imagine and during that period though how lenient or how much T leeway did they give you to catch up and learn oh none at all
(16:45) you know you don't walk into a pit and everyone goes oh look there's a new Trader you know come in what's your name right listen we'll help you make some money they're like okay lose this idiot you know we'll destroy him they're they're there to make money not friends and they

weren't polite it was very aggressive you know it every every second word was a swear word if you screwed up they would bury you it wasn't like it wasn't like go easy on him he's only been here a week it was like
(17:08) you know if you if you if you can't make it you are out and and people did go within days and then there was all the pranks as well which which made you feel like a complete idiot in front of the pit so you really I had to I literally had to become a different person because I came from a public school well spoken quite timid and you're down in this environment with you know really aggressive people you know they called them bar Boys east east London guys and all that and they were razor
(17:35) sharp and I thought if I don't almost become them I'm never going to survive and and you do you just start to you're in this world and you start to become this person I was swearing like a trooper you know uh go out and and I would come out of this environment but I would still be that person so I'm going back to my friends and I'm just this cocky mouthy Trader what pushed you to you know Elevate yourself to to be able to stay in that realm if that makes sense like what because as you
(18:05) mentioned previously like a lot of people don't survive like they'll be there a day or two they will not hack it and they'll be gone but you've still trading to this day like what pushed you in the that environment to to do that um I was really determined to succeed I suppose a lot of people are um I have a huge fear of failure um I don't yeah I just I have I I wanted to be successful not I'm not materialistic I don't have you know I don't own many big trophy things to show that I've done well financially but I have a fear of failure so every single day even now I don't need to work
(18:40) but I'm up at 6 and I'm looking at the markets and it's just it's just my life it's just who I am I can't could not do it I'm I'm trying to force myself to work less and be less stressed and that's a real challenge I can't seem to do it where do you think that that stems from is there anything that sticks out to you I don't know I think it's just who I am I think you know people some people are just like that I mean you know I'm not massively wealthy you know the billionaires and I think to myself why do they still get up up and do that I I met a guy um a couple of years
(19:10) ago lived in this huge house ex Banker obviously worth an absolute fortune and still trading and probably up and down 100 Grand 200 Grand a day clearly didn't need the money and I thought to myself why is he still doing this if he makes 100 Grand it's obviously not even going to make a tiny bit of difference to his life why is he putting himself through it but he obviously just couldn't leave it alone I mean some people just wired differently and they love the work that much and they enjoy it as we said it's like there it's almost like an addiction to the markets as well um
(19:43) which can be healthy or unhealthy depending how you treat it for sure but in terms of one thing you mentioned there the fear of failure I found that very fascinating because obviously in trading there's this really interesting thing that goes on where you lose a trade and naturally especially early on naturally you assume you failed you've done something wrong so how did you handle that has that fair of failure always been been there like been in sort of the mind yeah I think it's something that happened you know I can't um my father um was quite successful and then when I was
(20:11) 16 lost everything I think that was the trigger um to make me go out and think right I'm going to actually the trigger was I need to go out and save my family because we we've gone from having a nice lifestyle to absolutely nothing and and I don't think that's ever left me so that's probably the psychological reason for it um but um yeah I mean we all have losing trade I when I started trading I did all the stupid things everyone does especially when I transition to screen trading not using a stop loss and all that you know and I learned by trial and error you know when you lose
(20:42) significant sums of money you think right either I give up or I stop doing this I figure this out and learn how to control myself it's interesting though in terms of making that transition cuz a lot of the pit traders that I spoke to so far they stopped that their Edge was was in the pits and

therefore and I feel like maybe they were that involved in the pits that they believed that they they couldn't find an edge outside of it so therefore they chose to sort of essentially semi retire or move on to different things what pushed you to make that transition and sort of pick up
(21:13) the electronic trading I had nothing else to do um I was let me see now let's say it was around 2000 so I'd been I was about 32 years old and what was I going to do I I wasn't wealthy enough to retire some Traders were wealthy enough to retire some of them should have retired they had 7even eight n million and they blew everything um one of the most successful Traders on the floor was called Terry Crawley and he made more than anybody he was so smart the day the floor shut he stopped trading and went and did something else and made a second or third Fortune doing I think
(21:47) he bought every house in Kent or something and made another Fortune doing property so there's so many different stories but I think for me I was just like what else am I going to do and I was I was an options Trader so that transition for me was actually easier um because on the floor you don't have a calculator and you don't have time to so you've got to calculate your Delta your Theta your Vega and all that's going on in your head every time you do a trade and and then you got to get your hedge and you got to think okay the Market's moved well how how's my gamma affected
(22:20) this what's my Deltas now so you're constantly doing these mathematical calculations in your brain and I was so quick at maths we when we'd go out for dinner it' be like 14 people the bill was this and like how much is each I'd be like bang it's this much each and everyone you know but that that quickly goes when you don't use that in your brain right right now I I can't do simple mass for for toffee um but sorry I've gone off on one but when um so when we started trading options on screen it was amazing you click a button you buy a call spread and bang everything all the Greeks
(22:51) are updated you know exactly what your gamas your thetas your Deltas you know what you hedge how much you need to hedge so in some ways that was easier um there's there was a different skill set that you had to learn that's interesting actually that's interesting because like you say that that mathematics the keeping track of the orders as well uh was a difficult task I imagine especially in those chaotic times especially when the markets were really really moving um because one thing I
(23:17) got to learn about was like carry trades where essentially you know you're doing an order at one person but you're the person right next to them thinks you're doing it with them and therefore there's this random order that's just in the epha that's taking place and they would have to sort of essentially come to some form of agreement the next day or someone would have to take the trade oh yeah there was always an out trade but that was the one outr an out trade yeah oh I I had an outtrade um so back in I don't know early 90s there was an election and the Tories were expected
(23:45) to lose and label was expected to win so um it didn't happen the reverse happened so the reaction in the market was crazy and before before the Marcus even opened him and the floor was packed and short Sterling I traded short Sterling so that was um liore 3mon um UK interest rates now I didn't find out until about 5 minutes before the market opened I had an out trade from the night before I was like Oh and it was the wrong way of course I had to buy 100 Futures on the open and the market was up 100 so I was down 100 Grand before the market even opened I was like I
(24:13) don't know let's say I was 22 years old I'm inan a blind panic you know so anyway there that's my big out trade story for you how did you handle that sort of situation I had a boss at the time who was financing me so I his name was Roger he was in Chicago I had to call him at 2: in the morning and I woke him up said Roger I'm down 100 Grand the Market's not even opened he goes okay it's going to be a big day massive

volumes um he said I'll cover the loss just get in there and trade and so I did and by the end of the day I made the 100 Grand back wow yeah was crazy is was that not
(24:45) like a common occurrence in terms of the size but more so like those were the the mentality of the Traders like you might have take gone into the market with a loss but you then have essentially a Target to smash that day does that make sense yeah um I don't think we set ourselves targets I mean these days Traders are so much more disciplined and and you know I'm a I'm I'm a mentor I'm a you know I'm a coach so I teach people right you know have a have a day limit where if you lose x amount
(25:13) you stop and and when you hit your target you stop and all these controls that you have for risk management trade management account management we didn't have any of that in those days no one no one had even thought of it you know you just went in there and you traded um know mindfulness and uh and mental health and everything it just didn't exist you know you never let anyone know how much you were suffering mentally and we probably all were the pressure was intense I'd go home often
(25:39) sit in my kitchen with the lights out staring out into my garden which was black and just completely you know and all these trades are going through my brain you know but you you know now if you have a bad day well you can just switch a screen on and hide behind the screen I had to go into the pit and I had to pretend that I was full of this confidence and I hadn't lost any money because I might short load of oil and you know the the markets were moving and the volatility was creeping up and I I had to buy it back and I had to pretend that I was happy that V was going up
(26:08) all these stupid spoofing things that you used to do well really inside I'm like God I've just lost another 50 Grand this morning what am I going to do there's a lot more intensity yeah a lot more intensity to the dayto day because if people saw the fear yeah then they' be like he's short V we can squeeze him yeah exactly exactly that's that's what I meant about the order flow being in the room is that you're reading the emotions of the other Traders too to sometimes dictate your order especially if you've if you're one of the Traders with the large size um because one
(26:38) of the the people I interviewed from the Chicago pits he was responsible of 10% of the volume on the S really so like he was literally doing that all the time where he's just looking at trading uh but one thing he found interesting was that and that he mentioned was that because he had so much size there would always be these like not newer guys but guys with maybe like smaller bankr smaller size would kind of like feed orders to and allow them to sort of just fulfill some small orders off him okay um just cuz he had that much size and it's just it's just incredible like even
(27:08) just hearing your experience as well like those different insights like that different intensity level that Traders really wouldn't take on board today because they just wouldn't understand it like they feel intense and I guess it's the level of your perception and it's not saying that the markets aren't intense now they still are but like that the level of intensity that you would have to go through day to day as you say like having to keep your you know a very straight face when going into the markets regardless of the scenario po game every day yeah versus now
(27:36) it's kind of just people by themselves with the screens and uh even then when they take a loss they feel a certain kind of way yeah it's a good point we were playing we were doing more than just playing the markets we were playing each other we were we were spoofing each other I mean often I'd say to my mate you know um we we we we we kind of sort form alliances and we were like you know you longv yeah I'm longv I think we can squeeze this what' you reckon yeah and you just start you like bidding it and you'd be like bid half a tick higher has anyone Hit Me No Okay and then
(28:04) you're just constantly gauging the pit well I think I think I think they're short I think we can push this and and vice versa they they do that to me um it was great fun and when it worked it was great so not so great when it didn't work definitely what was that transition into like more

technical analysis uh based trading what was that process like for you let's take a break for a minute there guys cuz I want to tell you about one of our sponsors Alpha Capital now without our sponsors say it's not possible for us to host such incredible podcasts around the world
(28:32) and get the level of guests that we are getting so again thanks to Alpha capital for sponsoring the podcast now Alpha capital is one of the best prop firms in the industry so far this year alone they have done over $50 million in payouts which is absolutely incredible they have the very best infrastructure in place for longevity from an in-house broker so they can offer the very best trading conditions and platforms that all Traders love to use they're still able to offer services to the us as well so the US Traders can still trade with them on particular platforms they
(29:06) have institutional experience so they know how to manage a PL correctly and have such an incredible team on hand on top of which they have both a pro and swing plan so depending on your style and strategy you can choose which one is best for you now you can use and get the highest discount available at anywhere using Riz 20 5 so that's R I25 for 25% off all challenges the links in the description below so let's get back to the episode let's take a break for a minute there guys cuz I want to tell you about our sponsor trade Zella trade Zella is the number one trading tool for
(29:44) all Traders doesn't matter whether you're a crypto Trader a Futures Trader or a Forex Trader whatever Trader you are all you do is connect your trading platform directly with Trad Zella it automates and makes your trading journaling so easy if you want to be a profitable Trader you need trading a Edge and that is exactly what trade Z does it allows you to identify Edge maintain your Edge and optimize your Edge by automating your trade journaling indepth analytics back testing bar replay and so much more now W gets you 20% off your yearly subscription with trade Zeller so
(30:15) use W for 20% off your yearly subscription or RIS 10 for 10% off your monthly subscription the link is in the description below now let's get back to this episode so um after trading options on green um it became very tiring because with options you're constantly married to a position you can never be completely flat so every time I went on holiday I was never really on holiday my brain was in the markets and I had some horrendous holidays where I had to jump on a plane and fly back and
(30:42) really I was just like wow I've been doing this for let's say 20 years and I'm exhausted I just want to be able to trade Futures make some money or lose money chut and go home and bang start the next day so I started trading Futures and I thought well I've been an options Trader for 20 years how hard can it be you either buy the Bund or you sell the but and it either goes up or down but there's a lot more to it than that so I quickly lost 30 grand of my own money probably around 2005 206 and I realized okay I have no idea what I'm doing this is complete new skill
(31:10) set so I either keep going and probably lose more money or I quit and and try and find a way to get an edge so then I got into technical analysis and I went traveling and I read tons of books but you know you can read all the books in the world until you start applying it and finding a process and finding a strategy so it was a long process but that's how I got into technical analysis and then I fell into providing technical analysis for banks and and Brokers I was living in southern Spain and
(31:39) a guy that I knew set up a brokerage company said why don't you come and work with me and you know I wanted to take a break from Trading I think it was around the same time yeah I was studying technical analysis so I went and worked with him as a broker um and then I sort of let people know that I was studying techn technical analysis and they had clients like big Bank clients Deutsche Morgan Stanley you know those kind of guys so I started telling them oh look you know I'm looking at a
(32:03) chart and I think this could happen and that could happen and this developed into a service for the for the Brokers so I ended up doing less broking and I was just pumping out the levels all day long and they found it useful because they would use my levels to hedge their option

books and then when I left and they were like we want this service we'll pay you so I ended up developing this signal service for Brokers and now I do it for retail Traders what was that like in terms of that transition cuz I don't know if you you've seen But in like the retail space a lot of Traders on more
(32:33) these influencers offer signals yeah um but is it the same as that or is it different like they're offering signals in terms of let's say like you know Buy Here Sell Here stop loss here TP here Etc is it a similar thing or are you more just presenting levels um of Interest I try to teach I call it earn while you learn so I have a telegram group and I I get carried away so I probably give too much information but I'm constantly posting charts look look at this look at this pattern or this trend and this is what I think and this might turn into a head and shoulders and blah blah blah
(33:05) so I don't think people read half of what I put in there but some people do and they learn and then I provide a spreadsheet of trade ideas at the bottom it's all color coded so with all my levels um there might be 15 trades on there in a day four or five of them might only get executed in a day you know if if I if I execute five trades and three are winners that we've had a great day mhm um and I do that every morning um and yeah it seems to work I've had subscribers for years so um so we do make money in the long run obviously I have losing days losing weeks but generally we
(33:37) do make money what are your thoughts to to trading patterns because over the years as you can imagine it's always been a debate ever since the I think electronic trading in particular came around it's probably always been a debate in terms of what styles work and I've had not not only have I had Traders on the podcast but even like books when you read like Market Wizards for example these phenomenal Traders but they're very polarizing their views I one might be just pure fundamental Trader thinks technicals a waste of time can't be possible but then also the next page or the next
(34:08) chapter or the next Trader that you you read about is the complete opposite side of the spectrum pure technicals fundamentals are useless you don't need them um then obviously there are the few who blend the two and there's just so many different options when it comes to how to trade and what to trade um you what are your thoughts with patterns because one thing people say in terms of patterns is um is that the markets can't respect them because they're not going to you know the patterns always
(34:32) the same and it can't be that easy and they're too easily recognizable and therefore you the market maker is always after you you know they're always going to hit try and hit your stop loss and so on and so forth that's someone who uses patterns in your analysis how how long have you been doing that has there been longevity in that yeah I think there is I the patterns I use are pretty simple bull Flags bare Flags um Head and Shoulders Which is less reliable but when it works it really
(34:56) works so I don't ignore it I think that with the experience that I've got I've kind of got a bit of a sick sense of when to use it and when not to use it like here's a great example um this week I think it was Wednesday there was a huge bearish engulfing candle in gold and silver so if you were a pure technical you'd be like oh bearish and golfing candle right markets are going to collapse but I'm like no we're in a very strong ball Trend it probably means we're just going to trade sideways for a bit this I'm not taking this as a sell signal I'll still be a buyer on weakness um
(35:27) and uh that ended up being the right call because I think gold broke high this morning new alltime high yeah exactly yeah so just for context for the the audience it's the like 20th 20th of September now or is the let's just check yeah it is exactly I guess that well it's the 20th of September now Wednesday was fomc they just cut 50 basis points uh for the first time in all year or something yeah um and Gold sold off a lot of the currencies sold off but then as you said all have rebounded

(35:57) um which is fascinating so was it more so just a in terms of you classed six cents before you said it but really was it more so like we've been in such a strong bullish Trend and you've noticed that yeah one candle one candle yeah exactly one candle doesn't change it for me it would be a warning um but there would have to be a pattern for me to say okay the trend has changed so yeah there's a lot of experience that is drawn into this and you know I couldn't I couldn't write a book and say right ABC do this on every pattern or every it's just something that's in there so I you
(36:29) know if if people want to learn to be technical traders I would just say spend as much time as you possibly can in front of the screen looking at charts drawing your trend lines because trend lines are trying an error even now I'll put a trend line on and go no that doesn't look right I'll do that again um so yeah it's experience you know you might be a gold Trader but don't just look at charts on gold look at charts on absolutely everything while you've got a trade on have a look at as many different markets as you can and just keep analyzing and analyzing
(36:55) and analyzing because you don't realize it but you're slowly building this this six cents and um I I I compare it to driving a car I could tell you exactly how to drive a car you know easy put it in gear and indicators and mirror signal maneuver and how the traffic lights work but and you could go wow this is this is great I can do that but until you get in a car and you're on the road and you're dealing with traffic you know that's it's the experience that then you become a good driver
(37:21) yeah yeah so like when you first start learning it feels a bit daunting you're overthinking things um but then once you build that experience up it's like second nature it's like you get in the car and you start doing it automatically yeah and you think that's where your wealth of experience really comes in then when it comes to your Market breakdowns now and you're trading now is simply the fact that you've been on the markets that long transition through the markets and the different you know ways to trade uh from the pits to electronic um from options to Futures is it are
(37:52) you trading uh futur still or is it Forex cfds uh mostly Forex gold silver oil um and then Forex and the and DOW um NASDAQ and S&P those are ones I focus on I don't trade all of them every day of course but I look for signals in all of those markets so I'll I'll I'll troll through all of them every day uh as many Forex p as I can and then I'll just try and find Opportunities where I would be prepared to take a risk amazing and what what are you looking for in terms of uh style of trades or or is it scalping is it day trading swing trading I'm mostly swing trading um
(38:28) day uh I'm I'm 56 years old I've been doing this 37 years I don't need to sit in front of a screen all day you know trading you know nicking five Pips 10 Pips um so and of course if you're scalping you don't need my service you can just sit and scalp away happily so I'm I'm looking for lowrisk trade opportunities where I can risk 20 30 25 30 Pips looking for 40 60 90 Pips profit um so at the moment because volatility is relatively low compared to the last four decades ades so you're going to have to run a position overnight sometimes two nights in order to see it play out
(39:03) yeah the days of seeing the Euro move 100 Pips a day a long long long gone so um so yeah that's my strategy I'm a trend follower very simple I'm a trend follower I I can do quite well when there's a decent Trend like there has been in Gold Gold's been a great market for me sideways markets just pull my hair out and unfortunately the dollar has been in a sideways trend for probably two years I can't make sense of that at all I barely touched the dollar anymore um so yeah I I I buy at support
(39:30) levels in the bull Trend or I buy above above above on a break above a resistance or a previous High very simple how important has that been for your trading in terms of keeping it simple I think it's really important I think everyone every technical I can't even say it every technical analyst when they start and they're learning you end up throwing every tool on your screen you know oh macds and this and that and ichimoku

clouds and Ballinger bands and of course course you then have to filter it all out because you realize this is way too much information and and then you you know
(40:04) what they call it the kiss the kiss strategy keep it simple stupid I think everyone goes through that I mean all people that come to me all my students are like yeah I've tried everything and and so you get to a stage where you whle down and I and I mine's dead simple it's trend lines it's moving averages it's Fibonacci it's Candle patterns candle formations Trend following I have a I look at the slow stochastic that's it yeah would you say you when using the knows is there a certain set number of confluences you need to tick off before a trade is sort of valid for you
(40:33) I think I have a three in my head for some reason I like it I feel confident if okay we're in a bull Trend we've pulled back there's a Confluence of fibs and there's maybe a 100 hour moving average and maybe a trend line if if they're all coinciding I'm like wow I have to do this I mean as Traders we have no idea what's going to happen next I certainly I have no crystal ball I don't know what's going to happen next so all you can do as you said is find an edge and then when you find that edge it's your job to execute the trade and see if it works and as long as you're risking less
(41:02) than you hope to make and all the you know all the rules that we know about then um over time you should make money do you feel like there's a lot of Traders out there who share a different mindset in the sense that they are constantly searching for something that will allow them to know where Market is going to go oh absolutely yeah you think there's this Holy Grail where you'll be able to tell and and and people when they start they think that trading is all about guessing the right direction oh you know and they say to me where do you think Gold's going today I'm I have
(41:31) no idea that's not what I do you know I'm I'm long gold what should I do with it I don't know you know if you and I say to him well what why did you buy it oh you know I just thought it was going up where's your stop loss oh I don't no like okay you're not trading you're gambling you're buying something because you think it's going up you've got no exit strategy you don't even have an entry strategy okay fine if you're gambling it's like going if you like going to the casino if you like
(41:56) going to the horse Racers and you're doing this for entertainment absolutely fine but don't fool yourself that you're trading because you're not you haven't got a clue you've got no Edge you've got no strategy um so either educate yourself or just carry on having a little gamble where do you think the mindset comes from for Traders who are searching for that thing that allows them to you know know where the Market's going I guess it's naivity because they haven't got an experience obviously if they're thinking along those lines if they're thinking that the key to trading is
(42:26) guessing the right direction every day then they don't really know what they're doing um because that's not a strategy so I think it's just you know educate yourself and find out what what what Traders do read Market Wizards or whatever it is you know you talked about that earlier what do successful Traders do in order to you know what how how do they get an edge what is their strategy do you feel like a part of it as well is it feels illogical to trade if you don't know where the market going to go um I think it feels illogical to trade to just jump in just to randomly and
(42:57) spontaneously jump into a market I mean I did it obviously I did it like everybody else I I I messed up big time and and that's how I've got to where I am now um but yeah that's that's how we all start out um the thing is this is this is something that's really key for me so as a Trader you want to have some sort of certainty because the markets are so uncertain you know that's what kills humans not knowing having certainty in life in whatever aspect it might be um so the only way you can get certainty like how am I going to progress as a Trader how am I going to
(43:30) consistently make money is if you have a strategy that is reliable or no strategy is 100% reliable all the time but you know my strategy is reliable when Market is trending upwards or downwards then then I know that I can make money um now the only way to really understand your

system and optimize it is when you've got a data set of Trades so I've done 10 trades right how how have I done I've done 20 trades 50 trades 100 trades then you can start to analyze it and optimize it you can't analyze
(43:57) something if you're just jumping in randomly how where are you going to be in 6 month's time well you haven't got a clue because you don't know you don't even know what your strategy is so how can you possibly know where you'll be in six months time so um whereas if you have a strategy then you say right okay well I've done three months worth of trading and I've done x amount of Trades optimize it should I be running wider stops should I be more aggressive with my targets should I you
(44:20) know limit myself to five trades a day am I over trading you know you can break it all down there's so many different ways to break down your strategy and try to optimize it but of course you can't do that if you don't have a strategy so you have to collect that data without that data it's hard to ask questions and to how can you improve was that something though that was more on the electronic side or was that still an element even in the pits where You' be tracking your trades it really
(44:45) wasn't and I probably should have been um but no that was random but then I was an auctions Trader so I was trading I wasn't really trading Direction so much are trading V and you're trading spreads and you're trying to take a you know and you have the edge is actually being in the pit but buying at the bid selling at the offer mhm so just it was different era and especially the market was the dictator of that but what is it do you think about traders that aren't collecting data do you think it's just laziness um I just think it's probably they're getting started they don't really
(45:14) understand what they should be doing in order to progress and um and yeah and and some people do just genuinely love trading because they get a buzz from it so yeah and there's nothing wrong with that if you're getting an excitement from it and that's what you want crack on but if you're like no I want this to be a second Revenue stream or I want this to be my profession I want to make a living from this I want to um build wealth then you then you're not doing it properly and and be honest with yourself where do you think you're going to be in six months a year you know youen
(45:44) you haven't got a clue because you don't really know what you're doing it's interesting with that because I think there is a lot of people who maybe are misguided in thinking that you know they want to be Traders but they really are just loving the buzz loving that feeling that the market gives them um but they're not treating it correctly cuz as you mentioned they're like in terms of the journaling collecting data some people might be new and therefore they don't know better they need to sort of get their foot in their door before they get to that point but there's also
(46:11) traders who are trading for last five years still not collecting any data wondering why it's not going right oh I people contacting me every week I've been doing it for three or four years and okay well and I say to them okay so so give me tell give me your entry strategy in a nutshell just your entry strategy just your entry strategy how do you identify a lowrisk trade opportunity and they're like oh well you know I kind of look at the trend and if it's going up I'll buy it and I'm like that's not an entry strategy you know you've got to break it down you need to do you
(46:41) think you need to be specific in what you're doing really specific you should be I I I think to be a successful Trader and I'm sure if you read Market Wizards and you know well you probably know better than me because you've inter interviewed some phenomenally successful Traders and I haven't but for me it should be robotic you know this is why people create alos because it removes the human element it removes the emotion you should be able to say right there's an opportunity um where should I place my stop-loss where should I place my target okay does that fit in with my risk

(47:10) versus reward you know am I risking one to make one and a half or whatever it might be um uh and yeah and and and that's it it should be robotic you should know exactly where you why you're going to enter and at what price you should know exactly where you're going to get out if it goes wrong you should know exactly where you're going to get out if it goes right before you even execute the trade so there shouldn't be any emotion at all in the actual trade once it's executed it should be okay
(47:33) let the trade play out the only thing you should be doing is maybe trading you stop if it if it works okay some people add to a winning trade but if that's part of your strategy that's fine okay the M Gold's gone to you know 2608 or whatever it is today breaking to a new high all add to the position fine but that you're doing that because that was part of your plan we all know the saying plan your trade trade your plan yeah um that's really important being in the markets for as long as you have you've seen so many different all-time highs right essentially price Discovery
(48:03) you've seen so many times where pric has entered that no man's land and there's no levels to work on just as you said with gold just this last week has done it multiple times uh how do you trade in those environments what do you look for or or is it a case of sitting back uh no those markets work for me because as I said I'm a trend follower so so gold is is probably the easiest market for me uh has been for a while uh so it's broken into a new high simple I'll just buy some and I'll add to
(48:31) it if it keeps going higher I'll use Fibonacci projections for targets that's it you know it's dead simple I love that because I think the reason why I like that so much is so many people over complicate they assume as well and I think sometimes Traders can be guilty of listening to other people's limiting beliefs or whatever their beliefs maybe might not even be limied but just their belief is yeah because they they're looking for someone to give them that Holy Grail I think every thinks that someone else has figured it all out and nobody has yeah that's like there's
(49:04) benefits to having a community there's benefits to you know knowing other Traders more so I would say for accountability purposes for people to have understanding you know someone who to discuss with someone who understands what you go through in the markets but equally I I do see there's a lot of negatives too such as those moments where you people easily rely on that person's opinion relies on that person's thought process versus their own how important important do you feel it is for a Trader to have longevity in the markets to focus purely on what they're seeing and what
(49:33) they know oh 100% uh and also half of the rubbish I'm not I'm not on these forums I never have been um I was already a very experienced Trader when all this started coming out yeah so I I don't listen to anybody else but I did I did learn don't listen to other people um and half of what you probably read on there is rubbish anyway people are probably just making stuff up there's a lot of egos probably involved I don't really know but I would imagine so um no you can't listen to what other people think about the market nobody knows you have to have your strategy that works for
(50:06) you and you and your strategy might not work for someone else because strategies are also based on your lifestyle how much money you've got how much time you have to trade you know a guy that can can only trade in the morning before work would have a different strategy to a guy who's scalping all day or you know whatever or a guy who's able to monitor the markets look at them for 10 minutes every hour you know so your strategy has to be very personal so you really got to figure it out
(50:33) for yourself a part of trading I think that really does impl a part of trading sorry that I think has an impact direct impact onto Traders results is how well their routine is and how structured their rou is you know what's that been like for you can you walk us through like the sort of routine you've sort followed for the markets and your your trading yeah well the uh for the last uh whatever it is 15 years that I've been providing the service that I do I'm I'm I'm up at I'm up at 67 and I'm straight on the on the computer that's the first thing I think of when I wake up you know

(51:09) how how have my trades done how have my service done for my subscribers so I don't go and have a breakfast and a coffee or a walk I have to go and see what the markets are doing and then I'm just immersed in it you know I'm so interested in it um I can't help it I'm going down rabbit holes everywhere and posting starts on my telegram groups and this is what I'm thinking um and then yeah after a couple of hours I'm pretty much done to be honest after that I'm quite lazy I I I keep an eye on the markets but I know I'm done I'm not going to find a load more opportunities because I

(51:43) look at the one now I mostly focus on the 4 Hour chart and as I said earlier I'm a swing Trader so I'm looking I probably have to hold positions for 24 48 hours so what happens after that isn't massively important I might I might look at the screen two or three times during the day and update you know my subscribers if I see something important but but after that I've almost lost interest if I'm honest do you set like limit orders for your for your entri limit orders yeah and then therefore you don't have to do anything just let them take place limit

(52:12) orders or buy on a break above or sell on a break below so it's buy stop to enter sell stop to enter that kind of thing so yeah I'm either EI either trading breakouts or I'm trading a support and resistance so very much hands off in terms of the execution but obviously Hands-On when it comes to the analysis yeah yeah I think you should be hands off when it comes to the execution because I said earlier plan your trade trade your plan so for me all the work is done in the analysis right

(52:33) now I'm as I said I might have 15 trade ideas but less than half of them could get executed uh which is fine by me the majority of my trade ideas don't get executed the price never gets there but if the price does get there I think we've got a good chance of making money definitely and in terms of being a swing Trader especially across so many markets how much weight or how much are you looking at fundamentals oh yeah that's something I really take into account actually there was a period when I didn't because I do believe that markets lead fundamentals um so

(53:08) how could I explain this uh I probably one of the biggest examples was the global financial crisis of 20072 2008 if you go back to it on the S&P there's a huge Head and Shoulders patent building that was built and it was obvious to anyone who knew about Head and Shoulders patterns that the market was going to crash if we broke the NE line which we did uh so that wasn't anything clever it was just basic technical analysis but I was telling go uh telling um Deutsche Bank Morgan Stanley maril Lynch oh you know we've got this pattern and I think the Market's going to crash

(53:39) what could trigger that and they were like well nothing really you know there was nothing on the horizon economically but when you go back at it the markets the stock markets are already trending down because that's what our head and shoulders pattern identifies the fact that we've got lower highs and lower lows with already building a you put a label on it and call it a head and shoulders pattern but all is is oh we're now getting lower Peaks and troughs um so already you know the market was was dropping and it was just a question of would it accelerate to

(54:08) the downside would um people trading on margin be forced to liquidate and whatever and that's what happened um so sorry I've gone off on oh yeah so so I do but but I I studied economics at school I did a-level economics so I was already aware of um fundamentals and when on the trading floor you have to you know everyone's talking about you know what do you reckon for GDP uh in those days it was um the trade the trade balance that was the big one um unemployment wasn't really a big number

(54:40) uh nowadays of course inflation is the big one and then unemployment inflation we we never even bothered about in those days has it always been the case where like certain news reports will be the leading yeah you know impactful things I think so and they can be for a long period of time obviously when inflation started taking off what was it 5 years ago I can't really remember that became the main number because of course that was driving fed interest rate policy but in inflation was tame all through the 90s after vuler in the what was it was it 70s yeah once

(55:08) they got inflation under control in the 80s no one PA paid a blind bit of notice to it because it was constantly around 2% and the interest rate moves got down to zero you know a quarter percent moves see quarter per moves are normal now but when I but in the 80s half% 1% I remember being uh I remember going out for lunch probably having a beer and um I think we had pages in those days because we didn't have mobile phones someone's pager went you know I won't swear but then someone went Bank of England's just cut or hiked whatever 1% we're tearing up the stairs of
(55:42) the escalator I was ready to vomit by the time I got the the stairs I'm pretty sure I'd lost a ton of money um yeah 1% move but that was normally in those and they didn't Telegraph it they weren't like we're considering doing an interest rate rise we're concerned about inflation it was it was they didn't communicate these things to for some reason they thought they shouldn't communicate these things to the market so um the whole that that whole uh approach is completely different from central banks now that's interesting actually you bring that up because I
(56:10) didn't think of that so before would you say a lot of the meetings that are now very public pretty much live streamed on YouTube they were private they didn't want for some reason they thought they didn't want the financial markets to know what they were thinking and they do a surprise cut maybe thought they thought it would have more impact on the currency or whatever if they didn't well just safer maybe as perhaps Panic even though if anything could caused more Panic it's a shot yeah but it's interesting how like as technology has gone along we get more access and I think
(56:40) a lot of Traders kind of may even take it for granted because it's just always there true even on Twitter you know you really only need Twitter to keep to be keeping up to date with minute by minute um it's crazy because of course on the floor we we only had one reuter screen and and we were a disadvantage to all the guys who had the Bloomberg and everything up in in in the desks so often they would be be ahead of us by 30 Seconds they' come in dump a load of you know Vol on us or whatever it might be you know sell a whole load of calls Market would then by the time we're doing
(57:11) our hedge Market collapsed we're like what the hell's happened oh bang you know so and so said something or yeah and in terms of riskwise per trades when you're looking at swing trades what what are you looking at in terms of risk are you looking at Dynamic risks fix risk I i' I believe that I'm I'm just bug standard risk 1% you know if you if you then have five six seven losing trades in a row you're not down in enough money to sink you or Panic you if you're risking 5% and you have six losing trades you're down 30% that's going to crush you how you going to get back from that so
(57:45) for me trading is all about just confidence I call it mental Capital maintaining your mental Capital as well as your as your monetary Capital you know um you've got to be able to wake up and in the morning and feel confident go to bed at night and not be stressing and thinking how the hell am I going to make that money back tomorrow so just slow but steady wins the race have you noticed in terms of people protecting that mental Capital there's a lot of traders who trade when they don't
(58:13) have they're trading money they can't actually afford to lose meaning that they could afford to lose it and not like maybe be completely you know uh having zero left but it's money that they don't have savings so it really if you yeah they if they lose it it just means that they're going have to go back save some more put it back in the market and they end up in this cycle yeah it's not a good State of Mind is it do you feel like that it's a lot of Traders would probably perform a lot better if they were to focus on getting themselves in a stable position first doesn't
(58:44) have to be absolutely massive like super secure like a 12-month cash buer for example but at least get some months in the bank and then be trading with money after that point that can essentially be classed as money they can afford to lose yeah it's a really good point What's The

Saying scared money makes no money or something like that I'm not sure if I've got that right but of course if you're trading out of you're desperate to make money or if you're fearful you you're definitely a
(59:09) disadvantage you know you need to be confident and that goes back to my thing about you know trading robotically and planning the whole trade out and you know eliminating the emotion because okay let's say you're in a trade and you're desperate to to make a profit then you you've identifi and even if you're doing everything right you've identified the trade opportunity as I've said you've identified your stop loss and your target you're like right I'm ready I've got my trade plan I'm ready to trade the plan bang you're in the Market's going up you're like this is great
(59:38) we know we've bounced right off my support level we're heading towards my target right I'm up $200 then then then the anxiety sets in that you don't just get anxious when you're losing money you get anxious when you're making money especially when you're in the position that you've just described right I'm up $200 I really don't want to see that $200 evaporate and we've all experienced it you're up you're down you're up me down uh watching The p&l Swinging about and then the anxiety builds so
(1:00:01) if you don't have a plan you you you'll end up jumping out I need that money bang I'm out I'm out and then of course the trade keeps going in your direction oh God I could have made 500 then the frustration sets in and then it's Revenge trading and then it's fomo and it all kicks in and it just goes horribly wrong and it's just a cycle then from that point which then is doomed to repeat itself no doubt exactly until the work is done going back just quickly to the fundamentals me I thought was very interesting what you said so you think that fundamentals really is just priced
(1:00:30) in essentially so like let's say if something negative is happening fundamentally a lot of the time the technical aspect will be already indicating that fundamental in some sort of way I really do believe that I've well I've seen a lot of instances of it of it and I gave you that example already um yeah I I certainly have seen a lot of that I'm sure lots of people would disagree I mean there's no we can't prove it but that's my feeling yeah I think I think a lot of the time not probably all the time but the the the price leads the fundamentals because how often do you
(1:01:03) think why is you know why is this Market still going up when it should be going down based on you know economic statistics or something like that I mean um I I think the dollar should be sinking at the moment clearly we've had a very aggressive interest rate cut clearly you know the economy does seem to be slowing somewhat we know there's a $ 35 trillion dollar um debt in the US it doesn't make for a strong dollar does it particularly but I think everyone's short the dollar because of that and it won't go down so there's there's other factors as well how you've
(1:01:33) seen a lot of elections in your time no doubt and uh how often do you see that whoever is voted in has an impact on the markets like and you see conditions change based on policies that are said that's a good question I don't really have a good answer for you if I'm honest it's not something I've given a lot of thought to I don't think politics especially in the western world where where there are democracies and there are central banks that that you know govern interest rates and I don't think they have a huge impact obviously it would be different in a dictatorship only only
(1:02:06) when we had Trump he the only one yeah well that was really interesting wasn't it because everyone thought Trump would be an absolute disaster and then he won unexpectedly initially the markets collapsed but literally for like minutes and then bang they were off never looked back so that was fascinating it is fascinating though how we well he's trying to come back he's trying to make a come back now um I think he'll do it yeah I want it'll be interesting to see it seems like not like there's a lot of forces against him to try and make it not happen but I was saying as a Trader i'

(1:02:37) would love for him to come back just cuz he's he brought so much volatility so true um especially as we were talking about Twitter was the king of Twitter at the time you're so right those were great days for Traders we went from Obama you know and markets were so stable it was just so boring to to to Trump which was terrific yeah I've forgotten that that his daily tweets moving the markets and stuff it was crazy because you say like one thing one minute and a couple hours later you'd say they complete opposite thing and the markets would like this that's so true yeah
(1:03:07) gosh bring him back bring him back but in terms of like Traders you've seen as you said youve worked with Traders you've taught Traders you've seen Traders progress is there anything that really stands out to you in terms of something that a lot of the Traders you've seen progress and start to see profitability in the market is there anything that stands out that they've done differently to those who haven't achieved that result um probably just emotional control and not over risking yeah
(1:03:36) not yeah keeping the account under control risking some small money just the stuff that we all know use a stop- loss control your downside don't risk too much don't overtrade don't jump in spontaneously just stuff that everybody knows now I mean this stuff wasn't out there when I was learning to trade we we all learned by trial and error and that isn't something that we talked about when we go down the par or wouldn't be like now how are you handling your discipline you know how much do you risk portray because we didn't do that anyway so this is something
(1:04:05) that new Traders the resources that they have to learn just amazing I mean there's so much free stuff out there they really there's no excuse for not understanding the rules of trading I think an element of an issue that Traders have is that they have an abundance of information so therefore they overwhelm themselves they don't know who to listen to that's a good point but equally as you say though the rules that was interesting how you said that though there like the rules of trading
(1:04:31) have remained the same regardless yeah every game has its rules whether you're gambling or whether you're playing football or whatever it is every game has its rules but the problem is you have to set the rules in trading so when you go to a casino okay you're playing Blackjack um let's say you're playing roulette right you you you bet on red okay I put $10 on red the ball right no more bets so that's the start of the game and you can't change your bet and it's you know what you're either going to win 10 or you're going to lose 10 there's no other outcome the ball goes in the
(1:05:02) the wheel boom boom boom you either you either win or lose end of game right take your money off the table next game it's all very controlled you can't lose an unlimited amount in an in a in an you know in a in a non-specified time it's structured with trading there is none of that markets well crypto's open 24/7 so if you're trading crypto when does the game start the game starts when you enter the position the game ends when you exit the position or when you've blown all your money and the broker closes your account so no one's going to say right stop you know the game's ended
(1:05:36) you you take the money off the table now there's an infinite amount of income of outcomes over an infinite amount of time so the only control you have you can't control the markets you can only control your reaction to the markets unless you've got that set of rules and unless you've got that strategy it's all going to come undone do you have any like rules that you have in place for when you go into a losing streak or or Draw down is there anything any changes that you make no and I should
(1:06:07) but I'm very disciplined um so I know that I'll only risk 1% per trade and I know that if I have five losing trades in a row I'll only be down five or six% and I know I will get that back eventually because I always do I I I have losing streaks but then I will have a winning Street um but I

think it's a really good idea to do that and there are all sorts of different ways to do it some people cut the size down and then um they'll cut the size down the more they lose and then when they finally
(1:06:34) get a winner then they'll start adding to the winner anyway I'm not going to go through all the different strategies but I think it's a great idea to examine that if you're a Trader yeah definitely because one of the interesting ones is people may cut because I think everything has pros and cons right regardless of what what decision you make because when you cut one of the issues is that when you win you probably have a lower size to begin with as you recognize you're back into a winning streak right um but again it's it's a pro because you're taking less of an emotional toll
(1:07:00) as you're on the way down to and I think that's really key the emotional toll um is is really important do you think though because you have the data and the experience of knowing that okay my average losing streak probably is this amount you know I've seen this x number of times already so there's nothing to stress about so therefore you know being able to handle your emotions through those losing streaks or Draw Downs is a lot easier than it would have been maybe originally because you've seen it so so many times yeah actually that's probably a good point which
(1:07:29) was a bit in my subconscious but I'm I'm at an advantage I'm at the end of my career I don't need to make money I'm I'm trading for fun whenever I'm trading you know I I'll have $10,000 in an account um even if I blew the whole lot it wouldn't change my life yeah um I would never stick 100 Grand in and get totally immersed in it so yeah I'm kind of lucky I'm not starting out I'm not trying to make my money I'm not trying to build a revenue stream so and I do have that experience so it's
(1:07:57) different for me can we finish up on the story that was mentioned which was there was a time when you made a million dollars or a million dollars in profit on within four days can you break that down for us yeah it was 1992 and um I was in the thick of the of the short Sterling pit and so there was something called the exchange rate mechanism which was uh inflation was out of control at the beginning of the '90s certainly was in the UK so the UK Chancellor thought it'd be a great idea to Peg the pound to the Deutsch mark because the Germans had their inflation under control no
(1:08:29) problem but but the issue was that there were were different economic Cycles uh Germany was expanding as it came out of the UN um unification thing you know the war came down so um so their economy was was growing um our economy was shrinking so what we really needed was lower interest rates and a lower pound that doch Mark they wanted it quite High anyway whatever so it was the wrong time to be pegged to the Deutsch mark But the go government being governments they can't be seen to do u-turns so they had to say no we believe in our policy even though it was obvious it was
(1:09:03) a wrong policy so they kept this facade up for a long period of time and and interest rates kept creeping up and eventually they got to 15% because they had to force the pound to stay in this range with the deuts mark and of course people like George Soros realized it was unsustainable you know the economy was just going to tank and they'd be forced to to leave them mechanism um so they kept selling the pound selling the pound so anyway this all blew up one week and I was trading interest rates so we were getting like we had we were getting interest rate jumps of like 1% 2% 5%
(1:09:40) it was crazy so the market was all over the place I again I just happened to be in the right place at the right time and I was making like 250 Grand a day I was only like 23 um it was it was like free money there was just so much volume if you knew what you were doing it was it was it was all easy uh I'm not pretending that I was you know so amazing and and and I had a backer who gave me unlimited money so I could

literally be like buying 500 puts at at three Pips under intrinsic value sometimes um so I made a million pounds in four days and by the fifth day I was so exhausted
(1:10:18) we were all exhausted I couldn't even speak I couldn't get the words out I remember coming in on the Friday morning and everyone was just like it was it was it was a lot quieter and I was like should we go for breakfast and then we just all went home we was just so exhausted so it's pretty crazy I made four a million pounds in four days um but actually obviously it was an amazing thing to do but for my trading it was a really bad thing because having made that kind of money I couldn't
(1:10:43) be I couldn't go back to just trying to make a grand or two in a day so I was constantly swinging the bat looking for the five six figure sums and they rarely came after that so yes I did make a lot of money but my trading really suffered for a number of years before I pulled myself together again and so and I was like come on come back down to earth and that was just simply because of the you seeing such a huge rise of as you said like it was so easy to make that money did it just feel
(1:11:11) like your mindset wanted to replicate pure greed and um and to make a four figure sum just seemed so small it didn't seem worth it um so you know it was arrogance and um and and this is something that happens to traders that you know if you make a a lot of money at an early stage which is probably down to luck I think it could be really detrimental to your trading career yeah do you think it's also detrimental generally when you're back into society as well that even if you leave trading or still trading where you get this lack of respect for the money in a sense yeah that's a
(1:11:46) really good point actually I didn't have respect for money I'm quite lucky because I'm I'm quite Frugal it's just my nature like even now I I live a very very normal life I mean I live in Thailand the car that I drive is a 15y old truck I look like the poorest man in Thailand I I just can't be I you know there's not why buy a new car I just I'm over that I I have a Ferrari which is in England and I and I was Flash so Flash in my 20s I don't deny that but I'm over it now so I have a pretty normal house and you know um for me a good great days going for a nice long walk and having
(1:12:21) a decent lunch and maybe a beer before I go to bed you know I don't need to be in a flash motor or flying first class but um yeah so sorry I've G I've gone off on on a off subject there but yeah I think um is important to to keep yeah you've got to keep your feet on the ground and uh if you do have a have a big win remember it's probably luck MH um I think well there was a saying on the floor I'd rather be lucky than good and yeah we all need a bit of luck in trading in fact I I saw something uh really interesting on T Tik Tok or something this morning this guy billionaire was
(1:12:54) being interviewed and he was very humble he said and they and um the interviewer said what's one of the keys to your success he said well one of the big keys to my success is just luck a I was born in San Francisco you know if I was born in any other city in the world I I wouldn't have what I have now he said I'd probably be in jail so it's really interesting you know appreciate that you've had some luck and don't think that you're just this wonderfully intelligent person yes so like just being grateful being having gratitude and recognizing as well cuz I think a lot of the the I
(1:13:27) think some of the best and most phenomenal Traders if you really look at their pnls it's like they had certain circumstances certain moments where they were able to position themselves well to make that p&l which you could class as lot right to be you know have the right size available be there at the right time with the right volatility in the right circumstance I was in the right place at the right time just happened to have the right tools at hand and then I got arrogant and greed and It screw it screwed up my career for a number of years but you fought through well what was it

(1:14:01) that helped you to get out of that that probably a good good place realizing I better make some bloody money again because a million pounds doesn't last that long yeah you know there's some tax to pay on that and blah blah blah fortunately I was smart enough to buy some property and do some CL I mean I did some stupid things I bought two Ferraris and then I after two or three years I was like what am I doing these are depreciating sell them start buying houses so I did that so I got into the property amaz do you feel like it was like when your back was against the wall the
(1:14:27) lessons were there for you to just take them on board and yeah I had to really regroup and and get real and do you think that moment then really is what's allowed you to have such a long career though because you had that big moment you had those struggling years but then it was like the lesson necessary for you to have longevity because if you didn't learn it you would have just kept maybe going through the same thing yeah I guess that's probably true I Haven really thought about it but yeah I guess that's true yeah I'm I suppose I'm a Survivor you know I will keep going
(1:14:56) we love that we love that and hopefully we'll catch you again here on the podcast we need to get you for like a round table or something we love doing Round Table podast great be amazing to try and get that in but Jason thank you for being here thank you for sharing everything with us your links will be in the description below everyone so make sure you check them out and uh drop a comment of your biggest takeaway from today's episode I know there was so much U but there'll be other episodes on screen so make sure you check those out and until next time everyone take care

The Trader Roundtable: How The Markets Are Rigged Against You - YouTube
https://www.youtube.com/watch?v=wpPnnj83h0s

Transcript:
(00:00) welcome everyone back to the words of wisdom podcast we are back once again for another incredible Round Table we're still the number one trading podcast in the world and the fastest growing thanks to all of you and our incredible guests and guests is the right word because as you know with the roundtables we have multiple Traders with us today and we're going to go through so many various topics we have this is what I collectively probably I know at least over 70 years worth of experience at this table so we have none other than Charlie Burton Jason
(00:32) sen Paul Scott and Nick Leon with us today thank you all for being here jents I we're in this cold Warehouse it may be a kidnapping we don't know but um we'll just throw it out there obviously this is going to be airing in the new year and with the whole new year you get the new me right that's the normal slogan that people use unfortunately a lot of people don't last though they they they make changes for a month and then they go back into old ways in terms of a Trader who isn't quite finding
(01:02) that consistency yet what would you suggest the changes they should be making at this point to make 2025 their best year yet or their most profitable year yet I'll start with you Charlie well the first thing I would say is I wouldn't Define yourself as a Trader by the calendar year anyway most people do that they want to talk about how much money they're going to make each month or each year or you know and they Define themselves by the year we shouldn't do that we should be making the changes now not in January or whatever because you're setting yourself up for failure in

(01:34) a way if you're saying right I'm going to do this in January just like a diet it won't last so it's got to be something that you're going to be doing right away the number one thing I would always say to any Trader is forget strategies and all of that stuff um obviously you have to have it but really invest in your psychological side of your trading investing your time and energy in your mindset because you won't make it as a Trader you can have the best technical strategy in the world
(02:00) and you'll still completely mess up if you if your mindset isn't there cuz as soon as you go through a few losses out there you're going to get nervous you're going to hesitate and all of that mess that's going to come along so if I can say to anyone please just spend that time on the mindset and I guess and also sorry I'm pinching the time here but also extend your time Horizon as well don't try and get rich quick off this thing you know just see it as some an Endeavor that's going to walk with you throughout your life rather than something you're trying to do
(02:33) something within the next six months or so I love that Paul what do you think what I say to that um you know what I mean yeah do you know what I mean I was going to get there um I was going to get there I mean I'd say the same thing you you just got to it's not you against the market really it's you against yourself I would say um because the market will always do what it's always done uh the same people are just going to keep playing the game rules of the game ain't going to change but the only thing that you can change and keep a handle on is yourself and and not get too cocky if
(03:10) you get on a winning winning run and don't get too down in the dumps if you start to lose I think just be consistent do the same thing stick to the same thing um and when you've found what works for you uh obviously we all have different ways of trading we've all traded in different ways if you find what works for you and just keep it consistent and don't deviate and don't change um because at the end of the day you've got 12 months within which to make money you know and I've said to people I've been working with recently if you had 20 stocks you want to make 5% on each you got
(03:49) 12 months within which to do that so could you do that across a 12- month period I would suggest yes um yeah just keep it cool and try and keep a calm head um the same goes yeah what do you think Jason yeah keep a calm head for sure I'm just thinking because um well I I struggle around December and January I for me the markets that I trade they usually slow down a lot um August is usually a bad month for me end of December I pretty you know two weeks before the end of December I pretty much
(04:20) give up I know I'm not going to do particularly well and then you start January and everyone's like yeah yeah January here we go it's going to be a great year but you really do have to start slowly because I think the first two weeks of January you'll struggle to do well anyway find just find your feet so um yeah I think I think start calmly as you say Nick yeah I think the guys have encapsulated it quite well I think you know mindset is a key part um there's no point putting that extra pressure on yourself of giving you those dates and those Horizons
(04:50) where you have to do something by um we've all worked under pressure in our uh in our lifetimes and we've all had to adjust to that and make sure that we we get rid of it um I I I think you know emotions are the are the key and uh how you react to different situation so the more you can detach yourself I think Jason's right the beginning of the year is always a little bit tough um while people are coming back and adjusting to how they're going to how they're going to trade into the new year but uh yeah don't don't um set put too much pressure on yourself by uh giving
(05:24) you those defined dates that I've got to do so I this year this month were you know a number you've got to reach off the back of that actually it's a it's a good point you bring up in terms of noticing periods of time or particular months or particular times of the year which you don't really perform as a Trader is that something you've noticed as well Charlie o I'm going to go against a little bit what you said because I I'm more of a swing Trader position Trader so from a day trading perspective I totally get it you know that but that for me that period even

(05:55) between Christmas and New Year you quite often get some half decent moves for on a swing basis if I'm looking at an intraday chart then it's the price action is is as sticky as anything uh same with August at times but look at what just what happened in August of this year and people always say I'll take the August off and then you look at this summer and there was a lot of movement around in the market so I'm just quite pragmatic but again I'm talking from a swing position trading perspective here I'm quite open to whatever will be will be it could be the market shuts off in the
(06:26) second week of uh December and you might as well just shut up shopping come back in week two or three of January but it's not always the case just like uh the summer we've just had where we've seen quite a bit of movement around so I'm I'm always open to whatever go whatever happens but that's my perspective and we all have our weaknesses some people say never going to trade on a Monday or a Friday that was me yeah I was just going to say that was what I used to do not trade on a Monday
(06:53) but I knew people lose Mondays was the best day of their week yeah you know so interesting how about yourself for well I always think um you might run you know you know different banks whatever they might run their business march to March or Feb to fed or whatever but your trading year is Gen to December so basically for me and I totally agree with you last couple of weeks in in deck what's going on everyone's backtack trading cuz it's like right you made you've you've spent that year
(07:20) making that money the last thing you want is you know end of November the bus man says right was your p&l and you're like I'm up 10 million great m the last thing you want is to get to the end of December and he says right what's your p&l I'm at 5 million you'd much rather spend 300 Grand or something like that back toback trading just to make sure that you've you know you've kept it's cost you 300 Grand to keep you're not going to make a break your bonus in the last two I could yeah you probably
(07:51) could I have I bet you yeah you got got any December stories for us Nick I can't remember when they were paying our bonuses but yeah I just think you you got you got I mean again I suppose that's a lot of fact that in the retail Market I don't think anybody would sort of really get that because it's you know it's it's it is a big thing you don't want to do your bollocks in the last couple of weeks and I think everyone's just back toback trading and it's just like right like you said whatever's going to be we be I don't want any bloody positions I've closed all mine um
(08:27) yeah whatever happens happens but yeah you do get exaggerated moves but CU nobody really wants to take a posy the markets are so interesting though because I think there's such a disconnect between the the retail Traders and then what happens within institutions or the banks um because they don't think along that Sid they don't think about you know bonuses and how that might affect the bigger players in the market um but obviously having you know this is why we have these round taes and to thankfully have you guys on to sort of give those insights so people can think a bit
(08:55) differently and see you know why the CU people hear about December being sort of a month maybe to take a take a foot off the breakes off the gas sorry or same with like summer but they don't actually understand the premise why so you those very insightful there as well but you talked about having different strategies there because I know that you're quite a longer term position Trader as well yeah and then you guys are more day trading right you I'd like to be longer term but at the moment I can't I'm struggling to find ideas you know that I could run for a week or two
(09:24) but maybe that's just because I do have quite a shortterm view it's difficult to yeah well well for me personally I'm I trade Forex I try to trade Forex and you know most of most of the pairs that I look at have just been stuck in these big ranges for months if not years so I'm really struggling

to find something that I could put on and leave for even a few days it's just going between the ranges each side yeah yeah I'm gold has been a good one uh I trade gold and silver and you know that's a bit easier you can buy the dips but Forex I'm struggling with I will admit that definitely
(09:57) have you always been a long-term Trader have you transition to that no I transitioned well I was I started out as an options Trader on equities but um so started out as more of a swing Trader then became at some point in the 2000s going and then into the financial crisis very much short-term trading and then coming and then really I guess I haven't short-term traded since I guess 2016 I guess now really so um yeah I I find it really difficult like much like you find it difficult to see the longer term I find it so difficult now to read a a shortterm chart just you do you just
(10:37) lose it it's like oh I think I said before it's like having a sour spoon of hot water and you got to give it constant heat and if you don't it just goes cold so I can't go into that that realm anymore I find it very difficult just like you're finding it difficult the other way around how is z Nick cuz I know obviously you're very shortterm you know you're looking at specific timings as well profitable trading really boils down to two two things opportunity and volatility and that is why the podcast is partnered with Market Journal because between the years 2016 and
(11:08) 2020 the amount of opportunity that was available as well as volatility to take advantage of was at the highest is ever been and all of that really pointed towards one man president Donald Trump during his period in office all it took was one tweet and that would present so much volatility and the right Traders would take advantage of that and would create their record pnls and that is why those same Traders are so excited for this new period between 2025 to 2029 when we have President Donald Trump back in office now Market Journal is going to give you the weekly insights
(11:40) you need across crypto Forex Futures and the stock market so regardless of what happens whether it's a tweet a particular stock running up hundreds of percent whatever volatility and opportunity that market Journal can identify it is going to share with you every single week so you can purely focus on taking advantage of those opportuni unities and taking advantage of that volatility to create your record p&l now Market Journal is absolutely free all you do is click the link in the description
(12:09) below put in your email and you will receive key updates on the markets every single week so you are always up to date with what's going on and ready to execute when the time is right links in the description below thank you for enjoying this episode let's take a break for a minute there guys cuz I want to let you know about one of our sponsors Alpha Futures is offering the best one step evaluations in the industry they have the largest endof Day based draw Downs in the entire industry with up to 90% profit split and lightning fast payout speeds and offering
(12:41) Advanced and standard accounts to fit your needs Alpha Futures is truly offering the most elite plans for the lowest total cost to entry in the industry you can start as low as $79 and thanks to the podcast using Code Riz RZ you can get 20% sent off any of those challenges go to the link in the description below and let's get back to the episode I try to just trade the opening bell periods and and an hour around that I don't want to get too involved in the markets I find that you know much as I did years ago I probably start trading a bit too aggressively a bit too angrily
(13:19) um so I try and make sure I just focus on that period it's day trading you know I've got lots of baggage that comes with me carrying overnight positions isn't something I want to do anymore so I leave that well behind um like to sleep at night and and close the positions down fairly quickly but I just you know obviously coming from that Futures type back background I think that hour around the opening bell is conforms more to what you used to see in the pits there's a there's plenty of liquidity you're going to get a movement um and if you get it right you
(13:54) you get it right and so just really focus on that I I think you know just to Echo some of things that Jason has said you know for me again carrying a lot of baggage with me trading at new highs in in in the US indices and gold you know scares the life out of me you know like the only

way it's tough to buy it isn't it it's I'm not going to buy it so you know if you if you were sat in a pit against me You' just you'd rape me the trouble is I've lost so much money trying to pick tops that I finally realized that doesn't work for me either so EXA I do actually just shut
(14:25) my eyes and buy it actually that's interesting cu cu like you obviously I have a technical approach but you're mostly fundamental so to have that fundamental approach and be able to trade shortterm I don't know how you do it I just I just think it's more forgiving around that period Jason if you you know if you watch that period you get more two-way flow you've got the opening orders so you're going on gut feeling watching watching price action basically how it builds up to it yeah price action and how it builds up to it and I think you see you know if you go from day to
(14:52) day you see a lot of commonality you know Monday through Friday especially with the Dow when you see patterns and just recogniz it's probably something you can't really teach is it it's probably just something that you've developed um yeah it's just because I was searching for that period of the day that's going to be closer you know coming from a floor trading background to then having to look and try and make sense of something that's on a screen that was the thing that I kind of came up with and focusing on that period and and it is more forgiving like if you
(15:24) hit a trend straight off of the Bell it can be painful but if you're um you if you focus on that period and the price action you know it works for me not all the time I know a guy who used to just trade the open and the Clos in oil probably only worked for two hours a day did really well I don't know what he saw in that time period but obviously you know something along the same lines as you he just had he just had something that he could see M I think it's interesting just what you two have
(15:48) both said ultimately we all trade our own comfort zone yeah and I think that's really important for Traders and I know you know for people who are watching this they don't know what their comfort some of them don't know what their comfort zone is yet and you still have to find that but once you find it it's like Paul said earlier on you stick with what you know and you stick you know through thick and thin and what a lot of people do is they constantly jump jump around trying new things when actually sticking with the same tried and tested once you feel like you've got something
(16:18) stay with it because too many people jump around think there's too much information out there these days I think this this the world of I mean God remember back in the day you'd get rumors on the floor wouldn't you you know what I mean we'd get a phone call and there'd be like there's been a rumor of an earthquake in chili which obviously affect the couple price literally just a rumor you know what I mean take hours to get confirm pig to fly over yeah take hours to get confirmed it's so true but like now it's just like boom boom boom and there's so much instant news which can I
(16:53) suppose you know like you said you're struggling on a short-term basis is it too much news overload yeah a retail Trader pretty much got the the same access you know access to the same kind of news as you would as a bank Trader would have had years ago when we were on the floor yeah I mean I'm sure it same on simex you you were the cannon fodder when there was something like that you know because uh all the guys upstairs would get the rumor or they'd have a screen I don't know what it was like on simex but on life there was I think one reuter feed and so we would always be
(17:23) like 30 seconds behind the banks You' be you know bash get a load of calls and you be like oh no go do your hedge yeah okay I do remember again I do remember getting a phone call that's coming and it's like oh there's been a rumor of an earthquake in Chile so I jumped on the phone to the Copper trailer at Goldman I went there's been a rumor of an earthquake in Chile he went I know I went how the hell you know the rumor he started it brilliant he started it brilliant true in those days you could do that as Well's he's he's initials I won't say his name his initials were DM

(17:57) and his nickname was Shaq he was just little Welsh fell that took out basketball about 5 foot4 5 foot five and he told us and he said we've taking out basketball and we said you do they put you on your shoulders and run around me if you on but that question came back Nick in terms of uh are you looking at level two data as well is it just a technical chart like the bar chart it's it's just the price action around those periods and it's the patterns you know I think and again it's just been
(18:25) Ultra attentive during that particular period you know can you see a buy program coming through cell program to coming through I think you can you know you get it wrong sometimes as well but uh so you're not reading the tape you're literally reading price itself price yeah just price just price just focusing on the price and how it's moving during that period so it's the run up to the bell and and that immediate period afterwards yeah 20 minutes after the Bell I'm I'm kind of done really W that's unless I've got unless I've got unless unless I've got a position that's
(18:56) going the wrong way turns into an investment we've all done that yeah that's for one of the kids it's that's Christmas sorted do you feel that you can still even looking at just a price feed you're still in the same mindset of okay I'm looking at a screen but we're all still shouting and screaming at each other I I try to I try to to be honest yeah and that's and and that's why that period yeah because you know there's lots of flow coming in and uh you know you got all the opening orders and yeah the other thing I I I kind of look for especially when you're trading towards a high
(19:39) is if a stop triggers you know if you can see that on the price action as well you know that would be of interest to me I mean you remember years ago when people had ticked the market yeah yeah yeah tried yeah I'm sure it happens out there still on the screens you know as soon as you get up to that next price there's another one going off and M then the market Falls away and hunting those stops yeah yeah talking talking of stops one my first boss at credit I can say his name because he's not
(20:08) with us anymore but Grahams Grace and his brother Tony they were uh coffee sugar Coco Traders and they were known as the chainsaw brothers they were literally straight for stops really made a bloody Fortune really so that was basically what they did yeah look for stops all day stop hunting there wow nice that was back in the' 70s when it was not quite as regulated as it was as it is today well put yeah we get the picture yes plenty of elbows in the pit then you guys you know coming from a a
(20:42) pit trading background the transition from going from a pit a Floor Trader over to a screen Trader and most so many Floor Traders just couldn't made that transition really really tough how did you do it to be honest I'm was a bit lucky cuz the Metal Exchange is still open so that in itself is still it's the only outcry open outcry Market left in Europe um so that transition there cuz when I when I left it start they started to have lme select which was electronic but then we still the floor
(21:15) was still fully open you could trade an electronic you know pre before premarket after so it was kind of like they copying what was going on in the states do you know what I mean where you could trade like oil with bloody 2:00 in in the morning or whatever because you had the overnights and copper you had overnights um so for me it was the way in which I was taught because obviously I my dad was a Trader for a long long time and there was an example that I did actually want to give today so bear with me for the next five minutes I don't want to eat up all the time but he told
(21:50) me when he was younger so when he first started he must have been on the floor for be about the about 26 27 and there was a transition period on the Metal Exchange where you instead of trading in just tons they then standardized it to become Lots right so back then you could trade seven tons 13 tons nine tons or whatever and the volume on that market had start to go up a heck of a lot so they said right we can't just

trade in t we've got to standardize it's got to become a lot so now today one lot of couple would be 25 tons so he said we're in this crossover period
(22:29) and I'm sitting in the ring and my Clark comes over he says Harry buy a th000 locks at Market sorry sorry th000 yeah so buy a th000 lcks at Market make as much noise as possible and go and get it to close Above This price so he's gone he can't mean a th000 lots that's the biggest order of this Market's ever bloody scene he must mean tons so it goes like three months C five or so 500 no you have 50 right five a give eight a give buom bom buom so he jumps at he goes right who was that all the for he said was for manfried Manfred was the owner of the company so he jumps
(23:10) on the phone to Manfred he right Manfred you bought your thousand tons out he goes I didn't say [ __ ] tons Harry I said [ __ ] Lots really now get back in there and do as you [ __ ] told he was like [ __ ] through the phone goes running back in there cler you know bum bum bum right so he's going mental was buying everything doesn't even need to buy a thousand Lots but gets you Bell goes ding ding ding ding ding and it's closed Above This price so he gets back he goes why the hell did you ask me to do that and he went come back to the office and I'll show you he's okay
(23:45) in trade and so he went back and he went who that old before anyway when it was for us he went okay slightly strange gets back so this is obviously in the 70s right no computers this is all Avon graph paper all stuck together with bloody open high low close right and he said look this price here what happens when we get to it right this particular price what happens when we get to it gets there reverses gets there reverses gets there reverses gets there again closes above what have we just done on a global scale triggered all the stops you've triggered stops but you've
(24:26) also changed people's opinion of the value of that particular price there on a global scale he said I tell you what Harry I'll guarantee you next week copper is going up and the next week again this was in the 70s and how are we going to get all of these paperwork throughs remember confirmations been sent out in the post and all that Mal right he was like don't worry about that he said by the time all the bean counters done all that we be out of our position don't worry but yeah next week you went copper just like straight up and so for me it's always been about set prices set
(25:03) ranges the range doesn't fail a range will change value and that will happen especi definitely a lot in Commodities and stocks FX as well um but for me it's just how do I look at that price and determine which way it's going to go I don't I just hedge it I'll go fixed up either side hedge CU I don't want to be the the one that's going to pick a Direction but I just let the market then do what it wants and I know the Market's going to move from here direction for me I don't care it's just you know we make money out volatility right so I don't care about the direction so for
(25:43) me going over to a screen never really changed anything because I'm looking for these set ranges you boys going literally from open outcry to a a screen that's it floor's dead closed that must have been I went to prison in [Laughter] between you got I was going to say that probably help you had AP though didn't you for a bit of it yeah well actually for me it was quite easy uh at first because I was an options Market maker so I'm used to doing all the maths in my head my theas my gamas my Deltas I bought 250 spreads you know what's my hedge so you know I got really good at
(26:28) maths yeah and then suddenly you're in front of a screen it's like oh buy 100 of those oh right I know what my theater is my gam my Delta and you know where all the skew is and you just press a button and the skew changes so in some ways that was easier really because you know you didn't have to do the math so quickly and you you immediately know your Delta so you immediately know what how many Futures you've got

to do on your hedge um for me though I then got fed up trading options because you know you're just married to the position forever and you on holiday and
(26:53) you like storm monitoring the position you never get flat so I thought I tried trading Futures and I I thought well how hard can it be I've traded options for 15 years but then I then it all went to Pieces CU I realized it really is a completely different skill set I had no idea what I was doing I mean I remember at ril when they transferred over to screens and I remember the day cuz we were right down the other end of the office and all the life boys were all up the other end and I wore me
(27:21) yellow and blue today because that was Rouse's colors and but I remember when it went over and it was all sort of transitioning and the IT bloke had said right I put you on this dummy account here this dummy server so you can just get used to you know using the keyboard and King everything in and then all of a sudden their phone just lit up like a Christmas tree it wasn't a dummy it weren't a dum they were they were throwing Sid around the balls just lighting up and I remember I can't even never remember the guy's name who was the boss yeah but he was a fiery bastard
(27:58) and he was what the [ __ ] is going on and then yeah the r didn't he didn't last he didn't last the day yeah but blind me I remember that and that was just absolute pandemonium would be wouldn't it yeah I mean that's a percentage Jason how many people would have transitioned from life I think most people would have tried it I I think successfully they one of the biggest if probably the biggest Traer on the floor was called Terry Crawley he was just a genius I'm pretty sure sure the story goes as soon as they shut the doors at life he went I'm done
(28:32) and he never traded again he just went off and I think he bought most of Kent and uh and just made another absolute Fortune yeah uh but then there were other people that I remember names oh so and so you know who who was worth seven or eight million or something let say you know made a fortune on the floor oh he blown the lot went screen trading and didn't work so there was yeah there was quite a there was quite a lot of different stories for different people there was quite a few that transitioned to sort of running almost like brokerages themselves didn't they
(29:04) where they employed other people to yeah setting up prop Des some some people had the foresight to set up a prop company you know that didn't exist before but a couple of guys were like you I know we could open a big office we could pay get people to pay for desks and that whole business model evolved so yeah I mean it was it was uh like you say it was a big transitional period no one had done it before and uh yeah what are your thoughts when you hear that though Charlie obviously such a different real the pits cuz I get fascinated by it just hearing about it you can
(29:32) feel the energy just from their explanation of I was lucky to go to Chicago just before the S&P pit closed and it was great to just go and experience it as someone who I'd never had that experience but um having heard some of the stories I don't think I ever would have wanted to have been a pit Traer no no well the shagging down the alley down the side always I quite like that idea but um with the the runners and the likes but um but other than that no it sounded really rough there in
(30:03) Chicago and you've got to be a certain personality for I don't think I'd have been cut out for it to be honest that's so interesting because it is you are right there like the one thing you hear is just how ruthless of a personality you have to have to survive in the pits um and I think it's easy for like someone like myself I be like yeah I'd love to do that but then the reality is so different the pressure the the the speed as well and then obviously the errors that take place that you have to also catch up on as well it's a it's a whole different time and I think that the people
(30:32) coming into the industry now which would be a call a lot of the audience they just won't understand that or see that you know they even like even in the period from when you started trading loads have changed you know so much changes happened and as uh as Paul mentioned

earlier like now the speed of information and what's available to even the retail Traders let alone you know levels slightly levels above them is now just accessible all the time well I was paying out thousands a month on data and information 20 odd years ago and now everyone's got trading view chart for $
(31:05) 12.99 it's ridiculous I go to Twitter for the news you know it's great yeah there's some great just feeds on Twitter on the floor the one thing that was difficult and so different was that you had to do the face to face and I was about to say how tough it was when You' had a bad day and you had to go in the pit the next day and pretend that you hadn't lost an absolute Fortune because of course everyone would know he's short V Let's murder him some more but I would I would imagine you've got some better stories about keeping your face things were going wrong or right
(31:33) for that matter yeah I don't know if I've got better stories but yeah know it's painful J you know that yourself if you're on the wrong side of it yeah the uh so I think there was you know the aggressive side of the pits but you also needed to have relationships with people you know because you relied on on other people that were in there you know there was a lot of mutual respect wasn't it yeah amongst it always it was it was always good to be on the right side of JP Morgan and go every now and again when they came in and it obviously it's far more visual when you've got
(32:03) a when you've got a pit and everybody's got a different color jacket you can see who's doing what so that was all good but yeah just and we were talking about it earlier when we did our interview just you know it was constant bravado and trying to paint that face on that everything was okay everyone at your face so I mean that I can't imagine what and it's just Bonkers because you know I was manipulating Osaka and simex time so buying both buying both so everybody in Singapore is thinking that every time they trade with me they lose money and so you've got
(32:35) that side of it so you've got you know that it's almost as if you've got to be cocky on one hand but then on the other hand you know the reality of what you've just put on and how far it's going down the drain in both locations and trying not to break down crying and get really taken apart um because you know and again it's it's it's a bit like prison as well if you if you show weakness you're going to get they'll feed on you so yeah oh yeah for sure it was uh it was horrible that's the
(33:07) old man used to say if you think sharks have got a strong sense of smell for blood that's true yeah it's true and you'd be standing there in in the pit with guys who were your mates you'd go out for lunch with them you'd go out for drinks with them you'd you know even meet them up on the weekends or whatever but they'd have no problem taking money out of you and when knew you know that's what you're there for with the drinks before now non P payroll or after well that was free in those
(33:35) days like for example they didn't Telegraph what they were going to do with interest rates I mean now you know everybody knows when a rate mov is coming but in those days remember they didn't for some reason they thought it was a great the bank of England or whatever would think it was a great idea to surprise you so we would be down the pub we might have had a couple of pints rush back bang Bank of England just hiked half% what I know I've already done 50 Grand before I even get out you know and you're running up the stairs you got a beer full of you know a belly full of beer
(34:01) you want to puke and you you know yeah it's horrible there be some lising f sounds very professional expensive beers as an ex Floor Trader I know and he said yeah we'd all go down the pub for a few beers just before nonfarm payr just to get the Dutch Carriage up and um but again I I'm not recommending that to no it's a different world you know it's a different world and that's why it's so fascinating to me and it just shows how because in reality it's such a short time period of it's all of how much change has happened and continues to happen to this day that now we have

(34:36) such conversations about algorithms you know being so active in the markets creating you know keeping it as efficient as possible probably trapping Us in these ranges for long periods of time we have such a huge scale across the world of like economic mess and and you know just geopolitical situations that there's a constant change like every other day we go from like brexit to co to the US elections and it just continues it just continues on and on and again that information overload which is kind of a topic I'll bring into this discussion which we just had which is
(35:07) uh we were talking about how now there is so much information readily available free information as well like or everything you can imagine all various topics even outside of trading but especially in trading there's so much information technology you name it it's available yet we have not seen a change in success rates we have not seen a a itic change in people being profitable or more consistent and it was interesting cuz I had reflected on like okay everyone's got a very huge blessing if people want to work they have access to everything but equally because they have that
(35:41) access and we were discussing about how instant gratification nowadays is a real issue it's like people take it all for granted and they're not willing to they don't have the strong enough work eort because it's all just there in front of them versus well you know to take it back maybe two decades or even less where if you wanted access to some of that information you wouldd have to go out and really struggle to go find it some some information wouldn't even be available to you and yet they worked harder and may maybe the success rates hadn't changed but the people
(36:11) who really wanted it would go and get it while now it's like we're not seeing that we're seeing like just information overload and uh I don't know if you've reflected or or had any conversations with any sort of more retail traders who are entering the space over the recent years um but is that something you've recognize in Traders nowadays let's take a break from minute there guys cuz I want to tell you about one of our sponsors Alpha Capital now without our sponsors it's not possible
(36:33) for us to host such incredible podcasts around the world and get the level of guests that we are getting so again thanks to Alpha capital for sponsoring the podcast now Alpha capital is one of the best prop firms in the industry so far this year alone they have done over $50 million in payouts which is absolutely incredible they have the very best infrastructure in place for longevity from an in-house broker so they can offer the very best trading conditions and platforms that all Traders love to use they're still able to offer services to the us as well
(37:05) so the US Traders can still trade with them on particular platforms they have institutional experience so they know how to manage a platform correctly and have such an incredible team on hand on top of which they have both a pro and swing plan so depending on your style and strategy you can choose which one is best for you now you can use and get the highest discount available at anywhere using Riz 25 so that's r i z25 for 25% of all challenges the links in the description below so let's get back to the episode let's take a break for a minute there guys cuz I want to tell
(37:43) you about our sponsor trade Zella trade Zella is the number one trading tool for all Traders doesn't matter whether you're a crypto Trader a Futures Trader or a Forex Trader whatever Trader you are all you do is connect your trading platform directly with trade Zella it automates and makes your trading journaling so easy if you want to be a profitable Trader you need trading Edge and that is exactly what trade Z does it allows you to identify Edge maintain your Edge and optimize your Edge by automating your trade journaling in-depth analytics back testing bar
(38:12) replay and so much more now w r gets you 20% off your yearly subscription with trade seller so use W for 20% off your yearly subscription or RIS 10 for 10% off your monthly subscription the link is in the description destion below now let's get back to this episode um I think I think it

was already touched on earlier I think it's taken for granted really because they don't know any different anyway that they just assume that like you said you've got social media is going to tell you if there's an earthquake in Chile or or whatever so you've got everyone's got access
(38:43) to that everyone's got instant information and that really like you say that really has changed in literally in the last two decades because only around 2,000 or so you'd have an edge if you you know I was on certain platforms where you would get a nod if something was going on that's just gone now you you're not ahead of anyone so um I think it's changed but they in in a good way but they don't know any different but coming back to what you're saying about win rates well maybe that's what people should think about not be trying not to win as often that's
(39:17) the that's my that's the way that I like to look at things look at your risk reward more so than trying to be right as often I think the the current retail crowd out there are so obsessed with and I think it comes from life in general in life we're taught to be right as much as we can right from education and then you come into trading and you got to accept you're not going to be right all of the time and I think if people spend more time thinking about that and not obsessing about being right so much but actually considering overall profitability then it would
(39:50) stand up in better stead because you don't need to be right that often you don't that's why I say to people Hedge I don't I don't give a [ __ ] where it goes I don't want to be right I want the market to tell me where it wants to go that's you know that's for me that's a big thing that's a hell of a skill though that's and a mindset to get to it well I just say look level stop there stop there take profit Target is a target you Ain always going to hit it and they could move but I would rather pay the market some money to find out where it wants to go I'd much rather do that and
(40:31) then when you're talking about sort of regards to news and access to news and all this stuff's going on constantly if you can just take a giant leap backwards and just go right the Market's going to react don't care about Direction I don't want to feel my head full of all this news there's so much there and it's like you say it's instant but then it's like if I read that and I read that and I read that and I read that what ends up going on I've got a mish mash in my brain I don't quite know what to think so I'd rather go [ __ ] the News That's that that can't possibly
(41:11) process everything no you can't it's too much and whatever the news is anyway the market will go and react the opposite way anyway there's that but then loads of it's already factored in anyway unless it's unscheduled news and then you just think well if it's mostly been factored in unless it is something like you say you know back in the day we just do this with an interest rate and we won't tell anybody then yeah you'll have a quick revaluation but for me it's just like I know it's coming I know it's pretty much priced in if it's if it ain't priced in I'd be quite shocked
(41:46) you know but most of it's priced in so just yeah I'd rather do that I I've always said that rather pay the money to the market for it to tell me where it wants to go and then just ride that I think the summary of some of that is that you know there is so much news available it's available so quickly to you these days I kind of remember and maybe I'm completely misremembering this but back in the day like 20 30 years ago people would try and get their offices closer to the exchange so they got a better feed of some of the data coming back and you know it
(42:20) was that it was that speed of information that was coming back from the stock exchange yeah and that was where you got your Edge you know all right you know there was a more expensive piece of property there that was closer to the exchange that's how weird it is that that that's getting an edge right now I think there's just so much of it it's so readily available I've got a great story on that from from the US actually and this this guy's he's still it's genuine stuff isn't it but this is using the Postal Service this is proper slow so this is back in early 80s this chat he's
(42:52) in his 70s now he's still a tape reader one of the most successful tape readers out there in New York and um but back in the day he was like 18 years old and he subscribed you know the old investment newsletters in the US the the stock tip newsletters so they'd always tell you how the world's going to come to an end and then give you four stock tips at the end anyway so this guy lived in [ __ ] Iowa or somewhere out in the middle of nowhere and he noticed he got the brain for it at the age of 18 he noticed that he'd get his stock tips buy some shares and then

(43:26) about two days later the shares would all blip up in price and then usually a few days after that they'd gradually fall back over again he saw this pattern so he thought s holding on to these these stocks I'll I'll sell them after a couple of days and he he started doing that what he realize was happening is the publishing houses where they were sending these newsletters across the us all mostly to dentists and doctors and the likes his little town in Iowa was receiving the mail before Chicago
(43:58) all that so he got hold of so he got hold of the whole entire data for the US Postal Service and started seeing where these publishing houses were sending the mail first then opened up PO Boxes Across America subscribing to these little penny stocks uh magazines and the or news heads back in the day and then he would like literally pay someone little Runners to phone him up open his mail give him the stock tips he'd give him a you know five bucks whatever became a millionaire in his early 20s doing this ended up buying a a brokerage himself
(44:33) and became a multi-millionaire but he still to this day red tape like eight hours a day S&P futures and uh so basically he was one of the original hfts yeah good story I was waiting for you to say you went to New York Met this fell called Jordan and went I've got a [ __ ] great that's incredible this is what I mean like the this what I love and find fascinating about the Markus is there's so many different ways to be profitable yeah things have changed slightly well quite drastically as well but there's still a million different ways to make money from the
(45:06) markets there's so many different markets to trade there's so many different styles of trading uh and we have that even today like we have obviously long-term we have short-term um but then we also have like Paul's method which is like you the big thing with our episode that we did was like he was very polarizing and saying like forget technicals technicals no good I know the rest of you use technicals right um even though some people watch trying to argue that levels are technical but
(45:31) it's historical pricing historical ranges and you know if that's all the boys back in the day dad's age you're a little bit older than me you're a little bit older than me but we remember right if you're going to look at a chart it was a piece of paper you know but you can find prices and you can carry that forward and there's a methodology that I do use and you it's technical analysis I takes the F the first range takes me about 20 seconds and then that's it the rest of it just down the chart how's the market react there no how does the market react there and this is what
(46:06) I've been teaching people and they just sit there and go [ __ ] off Paul that can't work that can't [ __ ] work does go and do go and do 100 charts and you tell me that's not and he come to me I had one fell after doing this and I must apologize to people that I had haven't been able to answer emails and Linkedin messages and stuff like that I'm only one person and it's it went mental put it that way um but I L I showed him and he sat there for four minutes and I was like you right mate he went I can't speak I'm I'm choking I'm choking up I can't speak he went that's the most
(46:48) crazy thing I've ever seen and then that for me is what I said to you earlier can you put yourself in that mindset of we're shouting and screaming at each other it's through a screen but it's just all about price like we would all agree it's just about price then how's the market react to certain prices distances between these ranges and I what I say to people is find out your first range get rid of all your candles and just come down in a price then pull your candles back over and then
(47:19) you tell me what's going on here that for me is I think just gets rid of all that this technical analysis as in what people are used to I mean yeah look we had certain ta departments are at Banks of course they are but for me they're just there to paint [ __ ] stories to send out to clients that's that's that's that's all it's there for that's that's my own personal view um and I do remember teaching an analyst you worked for HSBC but on the retail side and you rang me up you went I'm

(47:52) an analyst please don't tell me to [ __ ] off um but yeah I I don't prescribe to technical analysis at all yeah but yeah but I'm going to defend technical analysis a little bit here I'm going to have to um we don't have to don't feel compelled oh no there two things one is you you like at the banks yeah they send out the [ __ ] stories like you say from the technical perspective that also do that from the fundamental crowd as well so they do they put it out from both departments don't they really but also from a technical perspective coming back to what I'm saying I don't
(48:25) need to be right 100% at the time so I'm quite happy losing 60 or 70% at the time cuz I'm I'm only interested in being right that the rest of that time and I can still make money so that's my defense for technical analysis so I'm just playing probabilities and risk and reward but I so I don't need to be right whatever it is 80% of the time no you don't need to be right 80% of the time to make money but I mean I just think for me to just feel is CH up with a load of [ __ ] lines and squiggly
(48:54) bits and pieces I like pinks and reds you got have your favorite colors on there especially especially at the weekend but no for me that's is I just like just the pess of a naked chart and just price that's that just what you used to you know it works for you for me I've done technical analysis for analysis for 20 years and I know I can find an edge most days yeah but like you say it's just can you get an edge and then right well I think I've got an edge in then you have to trade it and of course you don't know whether it's going to work or not but you're risk is small
(49:27) the reward is bigger that's all we can do isn't it because nobody knows what's going to happen that's actually a key point for like like new retail Traders are watching well I think when people first start trading think okay well I have to guess the direction every day and it's absolutely not what you have to do you can't possibly do it no one can guess the right direction every day and and you know the male ego kicks in as well you're having to be right all the time and it's just it's
(49:51) just a disaster well comes back down to certainty doesn't it people want want certainty as to what's going to happen next wrong game if you if you want certainty exactly yeah totally the only thing that is certain is that there will be uncertainty as you said it is just purely risk management that's the only way to to move forward I me one thing that was interesting though just off the back of your question earlier which was in regards to transitioning to the to the charts I think Paul's
(50:17) explanation of his was was really good in terms of why he does what he does in terms of just taking that same concept of from the from the pits of the at these price levels we know price will get get to those points and then once they're actually broken then we'll see price run to the next one so it's interesting to hear that actually because then you're just taking that philosophy and as you said it was easier for you to take that philosophy to the charts yeah um and it kind of goes off the
(50:40) back of what you were saying just stick to what you know you know and I think that's the hardest thing for most people to hear out there because I think a lot of people and it's quite good to to have you guys in here today for this sort of question as well because you've worked in the institutions you worked in the floors you've rubbed shoulders with professionals or had you know relationships and conversations with these professionals but everyone's looking for that institutional strategy that banking strategy they think there's a strategy out there that creates
(51:06) that certainty and allows them to essentially read the market like a book but obviously with the wealth of experience here and all the connect networks and connections that you've made over the years have you ever come across a strategy that replicates that that allows that almost here would we if we had I'll be honest huge yacht somewhere I think I think personally we could will sit here today come up with what we would say would be an amazing strategy and we'd still [ __ ] it up books
(51:36) what like they say put 10 elans in a room and you'll get 10 different answers about what the S&P is going to get sure you everyone's going to trade a strategy according to their own personality really you're still going to have your own little niggles towards how you want to adapt that

price action or as opposed to what someone else sees and like you just said you've got all the people who have been successful have come out of industry and they're all doing something slightly different to
(52:02) each other that says a lot that does that actually does yeah there is no Holy Grail there definitely isn't no Holy Grail at all there's we all have different opinions about how we make money from Trading but there is no holy grow there's there's there's no s of defined thing is there that you know because then every bastard on the floor would be doing exact if if if someone's found it they're not going to tell us so exactly so exactly we'll never know but I haven't found it was that ever a
(52:32) thing on the floors though as well where if there was like one particular Trader who was performing very very well that people would try and replicate or think that he had some sort of some sort of a edge to himself that they could try and copy um I mean it's a question for Jason as well I suppose as Paul but in Singapore um there were a couple of standout guys that that always did exceptionally well I mean you know some guys that have done very very well over the years got some mutual
(53:00) friends we you know who were exceptional yeah yeah they were exceptional they're very quick and you know um some of the things they got involved in they were just they were the best on the Block at that weren't they and um you know but that was their Niche and you know I can think of a couple of guys in Singapore they I think there's a certain amount of size always equated with that you know there was they were willing to take down some fairly big size as well and run with their run with their trades um but yeah we we've got a friend or a couple of friends who very very good
(53:35) at it I don't think you could possibly stand in and pit and copy them though could you no I don't think you know you can't possibly know what someone's position is in a pit no um even if you stood next to them all day long or or what they're thinking and how they're thinking about it and they stay in the trade longer than you as well sometimes you know you've got your own you've got your own breaking point and it probably comes before there's so I think the people that were the most successful cuz PE people you know people think oh trading will it's risky I've got to take
(54:03) risks but the most successful traders that I knew just didn't take much risk at all they've got it where you know well we're talking about Mark he would buy a thousand Futures no problem wouldn't wouldn't bat an eyelid but he he did that because he knew damn well he could get out for half a tick because he knew the liquidity was there he knew where the bid was and he would have absolutely no hesitation in going bang out and NE onto the next trade he wouldn't stand there and go oh it's two
(54:30) ticks against me what am I going to do you know it was it was like a machine those were the guys that did well in terms of that though in terms of like people's breaking points is is that something you've ever come across within either your trading or anyone you worked with where they just had hit a plateau for a period of time something they really had to work through you know when it came to their size or whether it came to the capital that they're trading with uh certainly I I got to
(54:57) a size where I I knew that if I carried on bigger that I was outside of my comfort zone certainly I did get to that probably around about 10 years or so probably a bit more than that into my trading and that can become a limitation for a lot of Traders but sometimes it's not a bad thing either to just know know your your limit really and know what's good for you cuz what's good for me at X number of lots may not be good for another Trader and he may be he or she may be well beyond what
(55:30) what I'm at so I just got to a point I thought you know what I've I've got enough here because people think oh they got keep going keep going but actually there's nothing wrong with actually this is me and I've found my comfort zone so so yeah I did it didn't just keep on going how

we Serv Jason uh yeah I think it's key comfort zone because you can't as soon as you start trading bigger then you're comfortable with your you're your consistency will probably go down and of course it's much nicer to be consistent and slow but steady wins the race I mean I had a problem

(56:05) with it because I'm a gambler so I was always trading too big and in the end I was just like what are you doing you know just just try and just I mean I I still do it to be honest I still go and do something stupid and I really think that I'm right about something and I put the position on way too big and I know I know I've done it because I'm constantly staring at the phone I'm looking at the price you know when I'm when I'm in my comfort zone I've almost forgotten I've got a trade on you

(56:26) know there's no one at the end of the phone anymore don't you oh no wonder I can't get my orders filled did you feel more comfortable having position limits do you know we didn't really have position limits um I was I was a local on the floor but I was like what was called a corporate local so I had a backer um a really sharp American guy who Nick knows um and he would give you enough rope to hang yourself I mean obviously we had Risk Managers and stuff and we would get a call and I was a gambler so I would put on quite position big positions when I thought I was right and wasn't

(57:00) always right um so yeah you would sometimes get a tap on the shoulder and go you sure about this you know come on you you need to ring you need to cut this back a bit but generally you it wasn't like we had position limits yeah yeah we had position limits I remember one of the fellas used to work with when he come and joined as gu called Neil poter he came across from AMT Amalgamated metal trading and he told a story that he his boss one called him and he Neil yes position limits yes you're always either limit long or limit short he goes they're they they limits they're not targets

(57:40) brilliant and then he said we know always in or I'm or I'm all out and he was like can you just cuz I keep getting the risk department and I keep getting these phone calls and I don't want to get these phone calls you just that's good yeah can you just you know down a little bit please but yeah I remember busting way through position limits I won't ask you um there's no point but I just and you talking earlier about screw-ups as well I mean I just remember one coppering we had Chris was the trader in the ring and we had plank key behind and

(58:21) everyone's on phones sell 250 sell 250 cross them don't think anything of it get out the gets out of the ring what's your posy long 40 no long 540 the [ __ ] has that happened uh plank yeah did you cross two buying orders sorry two selling orders uh no he said I said sell he said I said sell [ __ ] quietly go around then and try and get rid of your position but yeah I do remember those yeah position limits is there something in your personal trading though that you ever found a plateau at or any sort of barrier that you had to work through or comfort zone

(59:07) no I just I've I have a set amount of risk and I I don't go over it do you know what I mean I don't go over it I feel comfortable same as you would feel comfortable same as you would feel comfortable and you would feel comfortable and it's just the case of saying you know why put yourself under extra pressure when you don't blow he need to you know there there's there's no point I mean trading is stressful enough as it is why why add to it by going RT what I'll I'll stick an extra you know 25% on top of this trade or 50% on top of this trade what's the point that's true how

(59:42) about yourself Nick coming into so person you're not going to ask me about position Li it are you um yeah no look me in as a retail Trader now which is is where I'd probably put myself the the yeah no it's about being comfortable with what you're putting on and as Paul said there's no point stepping outside of that it's the discipline you know I still make mistakes same as Jason said I I don't think you completely eradicate them hopefully they're fewer in number these days um but yeah know get to that area that you're comfortable with um and and and stay there and

(1:00:18) have that discipline it is fascinating in terms of uh do you want to know what my position limit was did you have one I did yeah I had 250 lots of Nick 225 I was short 60,000 no I was long 60,000 Futures and short 100,000 options at the at the end and my position limit was 250 so it was like by 250 by 250 by 250 by 250 by 250 buying 10 I was buying 10,000 at Market yeah so is that is that a normal clip 10,000 for you some of them jeez fives tens and somebody in Osaka's taking that order off a scor box wow you know and then I've got Andrew bis the head a trading phoning me

(1:00:57) up and saying look Nick I'm seeing you I've got your trade sheets for today and there's there's one here that's clearly in breach of your limit and obviously it was and so the only thing I could think of at the time was to tell him that the system was grouping together trades at the same price and he swallowed it and uh you know I bought 50,000 Futures that day on a 250 lot limit wow I've got a story for you so it's really towards Nick here good story ahead of yeah it's all right um ahead of coming today I was um I was training with my personal trainer last week and I said oh

(1:01:32) I'm doing this thing next week and and um and he said I said um I was doing a massage he said for a lady her named Diana and um and he said and she's in her 80s and um he said I did this massage for her two years ago and he said and bless her he said at the end of it she wrote me a check and the check bounced and the name on the check was Diana bearing all right so wow and it was Diana bearing so he said um but actually it it checked but it was a cots check so I don't think Coots actually bounce checks I don't know why they do I used to work at Coots oh they do yeah we used to

(1:02:09) bounce them all the time ah right you get lots of people sorry you get lots of uh you know couples of divorcing and stuff like that and you know one of them goes and goes a bit mad with the uh with the checkbook I think she's just using that I bet she's doing that everywhere people just feel sorry for he said I didn't I didn't have the heart to go back to and ask for the for the money you'll probably get the same check next next massage as well I remember my old boss used to bank with coops here he laughing you and he he'd come in after a night out and hello dear Boy Yes

(1:02:46) um had a bit of a session last night more a bit more artwork um yeah wrote them a check could you possibly go and sell me some of nice shears cuz I think it might bounce thank you dear boy yeah did you how did you find because this was interesting because how did you find coming because we kind of come from the same place right I'm from ess6 you're from Watford right that's nothing like each other is way better but coming from there and then mixing with old tonians and M and yeah it wasn't

(1:03:26) well I I started at Coots right so um Coots wasn't really like that it was you know it was a lot of people from you know Suburbia Kent sort of area so it it wasn't quite that that that Stark baring was you know baronss was very blue blooded they all went to rugby or eat and and most of them went to Cambridge or Oxford uh along their career paths so yeah look I I I sat in a boardroom of a bank in South Africa years ago and um the all of the senior board members were there and the head of risk was there and she came up with this because they they were all asking me

(1:04:05) questions and whatever and she said the one thing I wanted to know is what do you think was your biggest attribute in getting you to where you got within the banks that you work for and so you know thinking on my feet the only thing I could come up with and I think it's the truth still to this day I was very socially Adept so I I could you know I could mix with the guy I grew up with on a council estate in Watford and I could mix with the guys I didn't have to like them but I could mix with the

(1:04:33) guys in bearings as well and if you were good at your job and you got you know and I was good at my job up to a point um you know you got respect for that and uh I was hardworking I was diligent I was accurate and and I was good and then it all went wrong yeah I just I love

they just did that eclectic mix of people from all wols of life and you know I've never heard anybody p on a Telly you speak like that you know what I mean that that was yeah that was a that was a trip but I just used to love it just the the buzz was so unique yeah I I actually was the other way around cuz I
(1:05:10) went to public school and then came down to the floor and it was all Essex boys that's that's an unusual transition that is an unusual trans well it was I was terrified obviously I mean I'm sure everyone was terrified when they went to the floor but I definitely was terrified and I really didn't thought I don't fit in here at all I thought I'm never going to be able to do this even the hand signals I was like how am I going to learn them everyone was so quick um and I literally just thought right I'm going to have to completely change who I am and you know just
(1:05:36) to to make it here and and I did I kind of yeah just kind of became an tic boy an honorary word you do though because you end up because you know everyone's cocking you down there and you know you know all the all the rhyming slang and all that and you end up just being like that yeah and that just was you know you you you you talk like that because everyone else talking about that you know do you guys still miss it it sounds to me oh God like you miss it I tell you what I miss the camaraderie yeah that is what I miss the most do you miss being stressed out
(1:06:12) your bollocks no um do you miss you don't miss [Music] prison how' you know that he nice andet took a pun but no I bad for a couple of weeks every now and again keep straight in there but no I I miss that I miss the banter like yeah like it's going out of fashion you know what I mean like I said we're talking about Danny earlier you know just stupid things like that and just it was brilliant bant you know when it was quiet the jokes and the tricks and the pranks and everything and that's great but do you I don't know I came from the insurance business fund management and
(1:06:57) I missed when I left and became just a Trader from home in two late 2001 I didn't realize what I was setting myself up for the the culture shock of missing out on the interaction was massive for me so um so yeah I missed it because I missed the banter and going into the office and all the meetings just being busy with people all day long to then being on your own it's a big don't underestimate just there's a lot of people out there who want to become a full-time homebased Trader and I always try and say well be careful what you wish for because it's Lon game it's a
(1:07:33) lonely game I think it's probably the loneliest game I reckon it is yeah I re because of all the the emotions and the you know that that situation that you got to go through on a daily basis it's tough It's True ble ready yeah battle ready do you know I mean that's what I call it battle ready because you could be boring couldn't it you just stand around like God there's nothing happening and then all of a sudden boom and you got switch on you got to switch on and I least I'd like that as well do you know what I mean I do i' moan about having big adrenaline dumps but then I
(1:08:05) kind of liked it as well cuz it was Mak you feel alive you know what I mean I sitting at home with a screen is different was great in my 20s I can't do it in my 50s you could still do it I couldn't you'd stand up all day for for one thing well we you couldn't sit down for8 hours we get you a chair J don't worry my legs couldn't take it these days is a whole different world though you know like just I think that's the big part of it like a big part of the those pit days was that that Community you know the people that you're going to interact with regardless of the trading side
(1:08:40) you have that while the retailers at home I think the reason why the podcast does so well is simply because they are alone so suddenly now they get to hear from other Traders and they get to hear the the different stories and actually realize oh wait you know other people are going through fomo or greed or the ego other people have these problems when I think when they're just alone and they don't really have any sense of community or know other Traders it's easy for them to think it's just them they're the problem they're the only ones who face these things it's like a

(1:09:08) thing thing that you and I were talking about um earlier today when we did the other podcast the you know just asking for help and advice you know I think is a key part you know because we all face different difficulties in life not just from a trading perspective and you need need to turn around and be able to ask somebody what they would do and you know if you're stuck behind a screen at home you can't do that so you know I can see why it works and it's true because everyone is actually going through the same thing yeah it's all overtrading Revenge trading fomo trading too
(1:09:39) big you know not using the stop we all been there everyone's going through the same journey and making all the same mistakes it's funny actually you say about not using stops and yet you speak to Brokers and still 80% of their customers still don't use and we're saying we moved on was talking about earlier on how you know this whole trading world has moved on with all the information that we have available to us and yet we're still Primal animals and we still behave in Primal ways you know and that that fear of loss you know so people just don't put a stop in because then they
(1:10:14) don't get stopped do they and it's amazing that Brokers still tell me to this day that a massive percentage of their retail book still don't do it really yeah well doesn't surprise me I suppose is why 90% of is it 90% of Traders fail or what or clients fail they say they won't tell us the real numbers yeah it's the classic it 909090 90% fail in 90 uh lose 90% of their account in 90 days oh is that the one that's what the one that's one they say it's probably like 99 it is insane though it is insane but we're thankful like to I think it comes down to people's drive
(1:10:53) and work ethic really in terms of like they have access to all the information all the technology everything that they could have in terms of tools when it comes to trading though it's uh is one of the loneliest games and CI is one of the hardest games it's one of the probably only ones that you can do from home with and whether it's good or bad has a low bar barrier to enter um and essentially the amount of information that's available can really get to a good level um not maybe profitable
(1:11:23) but a good level to understand what's going on and understand the markets for free so there's an opportunity there for those who do take the right actions but again it kind of comes back to where we're at I think as a society where there's just too much instant gratification and not enough grit people just really don't have that mental fortitude in their everyday life which then for when they try and trade it's just a recipe for disaster uh and most of all i' say um obviously Financial education hasn't really been a big thing you know ever you know even to this day
(1:11:58) and that's something that is kind of needed for trading I think because a lot of Traders come in and the reason why they're so emotional is because they don't have a financial Foundation they don't really have a strong savings a lot of people coming in from a place of debt which is a really dangerous place to come into something like trading with and even if you know I'll say it over and over again in terms of like if you're in debt the best thing to do is just use your demo use simulated use the time to build your skill find your Edge build that edge and yeah it's not real
(1:12:27) until you trade live for sure and the emotions aren real but at least do that whilst you've sort out that financial situation but it's just that speed you know it's that instant gratification again like you're saying like it's just that speed they want it now they need it now and they come to something like trading with that mentality is just it's a recipe just to to not make progress and do the opposite all that ends up happening is you go in more debt and then suddenly every time you trade you're thinking about that money that you already lost and then the money you want to
(1:12:52) make as well and when it comes you get debt out of sorry Deb desperation desperation out of debt in your example but you also get people who are desperate toce because they hate their they hate their work they hate their J boss you know and they they're seeing this as a way out so they it's still desperation and whatever way you cut it you won't make it as a Trader if you're trading out desperation and you've got to

find a way to have that that calmer approach because if you're desperate to succeed you're putting a timeline on it and you got to make this amount of money
(1:13:24) it'll just always evade you it will always just be outside of your your um your site so yeah it's and that will make that will make you do things that you shouldn't do yeah yeah yeah well because it's it's pressure yeah we we can't trade in pressure and so we have we've all just said it we all want to trade within a within a given comfort zone for ourselves and yet we've got people who want to put that pressure I'm going to quit my job and now they've got to you know pay the bills at the
(1:13:55) end of the month and they've just had their first day of the trading month and they've lost money and they're already on the back foot and I'm always trying to say to people just take the pressure off um doesn't matter what your job find another job find another boss but you put that pressure on yourself to trade full-time that's I think really let's be honest you've got to be a unicorn to be fully trading with no other source of income fulltime you you know you got to have a lot of experience and a lot of money behind you and most people don't have either of those
(1:14:25) I was going to say with the instant gratification thing that's the that's through technology these days and you know what I mean kids these days it's we're going to sound like a bunch of old FS but kids these days it's a totally different bloody game I mean come on we're all 70s 80s kids we had patience you know patience talk about mindset we had mindset because you'd have to sit on a bus yeah all you had was your own thoughts when you went went to the L you actually just went to the L and you had your own thoughts we didn't tweet we wrote letters that's so true when you sent off
(1:15:01) for something you had to wait 6 weeks for it to roll yeah or when you took photos you had to go and wait a week for the photos to be developed now your viewing numbers are going right all the older ones are going to stick with no but it's it's the thing though that's why it's so important because and that's why I was so excited for this one because even with me I I really grew up in like the transition like really in the transition like I dial up internet so I obviously I didn't know before internet but I dial up internet you know but like people we had phone box so true
(1:15:36) how many people now don't even know what dial up is hadone and even that's shocking to me right um but yeah like it's just it's interesting and I know everyone at home even for people who don't know or understand those things don't don't you never seen your first fax machine yeah and and faxing I like the phone box because if you went to meet mate for lunch you know and they and they didn't turn up he's like well how long do I wait for he called his mom did he did he did he leave you know it's so true am I on the right phone book so yeah but yeah I
(1:16:09) mean I remember the amount of telephone numbers you add it in your head that's so true that's a big thing I mean literally there's no training and memory now like no one no one needs to remember a telephone number an address directions know people I know people in my own City with where they're just coming to my house and surely they've been there like 20 times but they'll still put on maps they'll still put on ways and still make if they don't put it on they'll still drive past my house
(1:16:34) I don't know how that's possible my kids don't even exchange phone numbers with people they're on Snapchat or whatever it is if can have your snap or your Instagram or something they even so I'm so I'm so left behind I can't I can't wait for the title of this little chapter going to be old farts they won't be flipping thisit they used to do in New yorksh that um that TV program that's what they should called it yes yeah yeah Last of the Summer War Last of the Summer we had a g I think they're all dead so we're taking over well yeah we had
(1:17:07) a g on the floor used to work for Revco he come from new Yorkshire so his nickname was compo I just I remember just turning up and going what you can put a piece of paper in there and press a button and it comes out in New York yeah that's [ __ ] crazy that's crazy stuff you

know but I remember having to do that one of the first jobs uh when I was at Rous was go and get U go and get all the all the traders to put all the all the forwards on a piece of paper write them down and you a manually send that out to every freaking client
(1:17:44) in the morning just so that when they got there they had something to sort of work off you know obviously spreads are going to change throughout the day but s it to sort of work off and um yeah used to take [ __ ] ages honestly you had to send it one at a time yeah one at a time like ages and you'd be like lit half an hour like oh God's sake yeah but then email came along and yeah I mean all them older boys were just what the hell's email the fact guy got sacked yeah that's a lot got promoted they're the choices they're the choices yeah one thing that really res res Ates with
(1:18:26) um you know the amount of Traders I've spoken to whenever I've spoken to them theyve always they've always blown up every single Trader I've known has always had a blowup moment or really you know really low moment in their trading Journey whether it was from losses whether it was from blowing up their account whatever it may be but that was the thing that taught them a lot of the time that's what they can attribute to their success the lesson came from that or one of those moments sometimes it's multiple but one of those moments that allowed them to say okay you know here's my
(1:18:53) that's how they found their comfort zone that's how they um found out you know I keep doing that and I keep losing and I keep losing my account I need to change it was the thing that either hold them accountable but equally there's other people who've obviously probably not come on the podcast because they're not trading anymore but probably had those moments and left M can any of you share or or speak on maybe one of those moments for you and what lesson came from it that allowed you to then you have to start progress up there's no point me that you all know mine I was going to
(1:19:20) say if you don't [ __ ] up you don't learn yeah you know what I mean you you you you have to get things wrong otherwise it's just or you have to recognize it in yourself as well that's a that's a big thing if you know that you're I don't know um you get excited really easily or you panic really easily you've got to try and get a grip of yourself and just you know just try and be as Serene as you as you possibly can but we've all [ __ ] up some more than others we've all [ __ ] up but um you know it's God [ __ ] UPS [ __ ] UPS made on on an an out cry floor with some of
(1:19:56) them I told I won't go over the story again cuz I told it last time but yeah if you can't buy it you can sell it from oh God that was brilliant absolutely brilliant but yeah from a personal basis yeah screwed up lost money been impatient um going from I think the biggest thing for me was going from having all the information and all the order the flow around you to not having it and sort of then recognizing right hold on I've kind of I've lent on that a bit and now I haven't got it and you screw up and you have to sort of you have to change the way in which you do things
(1:20:36) cuz that is going from around a bunch of boys and girls to being by yourself but yeah if you don't screw up you don't you don't learn it's true I definitely had a light bulb moment in my trading yeah I've blown up early doors like everybody and then I got into a into a part of my trading where I could go for a whole for a whole year and not make any money well this went over a period of two years just not making any money I wasn't Lo I'd got to the point where I wasn't losing any money anymore so I knew something was okay but my Equity would just go up and then pull back down
(1:21:11) again and and really all it was was emotions I was getting overconfident I was a greed-based sort of individual Trader and as soon as I had a good winning spell I'd then start overtrading trading a bit too big size and then then the Equity would come back down again then I'll tighten back up go back to my rules get a bit more disciplined again and then gradually the equity go back up but I'd ke keep repeating the same mistake because over a period of a year you've forgotten that four months

(1:21:38) ago you got a bit greedy and now you're in you're in that whole greed Zone again and You' I would repeat the same cycle over and again and then it really was just a big old review that just B this light bulb moment really to think okay know if if I just can maintain that discipline that I have when My Equity curve is down here and keep that discipline when I'm starting to feel that overconfident then maybe My Equity can break out and so that was really the hour half for me simple but it wasn't the blowing up because we've all done that and you know you know if you get past (1:22:15) that then you you've got a chance but I still had to overcome did you have to the zoom out and look at that period of time is that how you sort of observed that yeah yeah um because because you do forget if you don't go back and review you very quickly forget and I was quite enjoying it I was just a part-time Trader at that point I just enjoyed the process of trading enjoyed being involved in the market and and then realizing hold on a second I can make more money than this because I've proven it to myself but then I seem to just start thinking well it's only a bit
(1:22:45) of profit I'll use some of that profit on this on this trade here um and then that doesn't work out so then you start trading a bit faster and venge trading and you know and then the whole cycle repeats itself again so it wasn't it was a simple thing but um but it was a massive thing at the same time defin how about yourself Jas it's going to resonate with everyone that you know I can't really add anything to it it's just spot on and I think everyone goes through it you know and even to this day I still put trades on sometimes and they're bigger than they should be so um but (1:23:20) yeah I'm sure everyone goes through exactly the same process definitely an amazing thing that's you know with the wealth of experience around this table is you've all been through different Market Cycles like bull markets bare markets ranging markets like is there any particular things that you look at or look for or do when you're experiencing a change in Market sentiment you know when it comes to strategy is there a change in Risk do you have to just step off the gas completely and take times out anything along those lines when you're experiencing or (1:23:51) noticing any changes in the markets uh I'm a trend Trader cuz because it's just the easiest way to trade so for example I talked about gold earlier that's been great and you know almost maybe it's a bit cocky to say easy but um it's not hard to find Opportunities put it that way um I struggle with the sideways Trend I'm not a scalper so I have to be I've become quite quick at spotting when the market is moving sideways uh that's something I'm quite pleased about and then I realize it I'm going to struggle basically yeah so then you just step away from those markets all (1:24:29) well how many pairs you're looking like quite quite a diverse amount of pairs right uh well I yeah because I have a service where I provide signals every day so in order well at the moment in order to try and find signals especially in Forex I'm probably looking at as much as 30 pairs um yeah so so that's definitely a problem I don't want to have to but but and I I don't trade every day at all but because I try and help people then I am looking at that many markets how we so Char um there are times in the market when look nothing's ever 100% ever but there (1:25:07) are times in the market where you do feel you're more in a comfort zone coming back to what you're saying about gold over this period and for me it's when sentiment is high in a given market so if you take uh what the spring of last year as an example and think back to the S&P and and US markets at that point we just come back off of we'd made the lows in October 22 and so we're now in what April May of of 23 and there's still a huge amount of pessimism out there towards the stock market everyone thinks oh no this is going to be a much bigger bare Market Paul tudah Jones
(1:25:46) has come out in the January of 23 saying yeah we've you know I've got my recessionary playbook on and all of this sort of stuff and yeah and then you go and look at the cop report you look at the Futures Market positioning which was which was massively short as well and yet you've got the S&P talking of ranges just nudging that range it kept on bobbing up a com what the level was right now so I was just buying the

breakout and so when when I get that com that uh overlap of sentiment where you've got a huge amount of pessimism but the market technically isn't isn't respecting the
(1:26:22) Market's trying to break out and you've you you've got all this negative sentiment that to me is the is a a lovely combination of things that i' love you don't get it all the time unfortunately but when it when it does come it's don't miss it I think sometimes you just got to stay out I think if if you look at the period where we are right now is we've got the US elections what less than two weeks God is it yeah wow two less than two weeks it's all kicking off in the Middle East and then we got a decision coming from the FED for me I'd be like that's there's a lot of uncertainty
(1:26:54) there don't know who's going to be the next president not quite sure what's going to happen in the Middle East sometimes I think you just need to take stock where you are in space and time and go Market's going to be there when the uncertainties disappeared so I think again it's just having that mental discipline isn't it to just realize and go yeah regardless if if I step away and take a holiday for two or three weeks it's going to be there when I come back and turn the screen on yeah that's good advice yeah I think Paul makes a great point there but the um
(1:27:25) it doesn't really apply to me so much because I'm just trading that specific time frame so um you know like I said you can get caught on a trend within that time frame it doesn't happen that often um but yeah now I'm just focus that that time is going to be there every day anyway and there's there's going to be movement so it suits what I'm doing at the moment business has to be done and it yeah I think that's I get I think that's because I said this last time just thinking in the retail Market people don't know about Market on open market on close orders
(1:27:58) and stuff like that and they kind of never think to incorporate that into and and as much as there's not supposed to be any stop hunting and there's not supposed to be any spoofing before the Market opens there's still plenty on it yeah I'm not aware of that there is 100% so that is what helps you actually by big little hang on a second so all your experience allows you to spot that is that what you're saying a little bit yeah yeah little bit but yeah like the the the run up the 20 minutes before the down opens you real you get a good real a real good feel for it then yeah
(1:28:32) it tends to turn at a certain point okay okay well that's experience the patterns as well yeah I mean you couldn't teach me that I would imagine that's just that you probably even don't even know what you're seeing sometimes it's like a six sense is it um I don't know if it's a six sense there's definitely patterns that yeah it's a bit like I guess it's a bit like when what we said earlier on you get people reading the tape and there's patterns within that but to most people it's just
(1:28:59) [ __ ] goo when're looking at the at the orders and talking about spoofing and all of that going on but um but yeah it's amazing what you can do I'm sure when you're just sitting there seeing the same thing day in day out and expecting it that's the thing you expect to see it didn't you yeah you know and it's if it ain't there then you like something's up here what is your thoughts in terms of intuition like when it comes to that gut feeling you know when it comes to a trade it might not fit absolutely to the mark when it comes to technicals they might not fit absolutely
(1:29:32) marked to the fundamentals but you have this gut feeling about a trade how much does that play into your trading if at all start with Jason um loads I think I think you can read all the books in the world and you can trade all you know um and study well from my perspective technical analysis and really understand all the patterns and everything else but until it's experience there's no question question is that where it stems from you yeah experience yeah big time I think you can you just get a gut feel for it it's like everything in life isn't it my son's a a footballer um and you
(1:30:04) know the longer he plays football the more he's just got a feel for the game I think it's Sports it applies to everything how youself Charlie yeah well gutfield for me Works in two ways sometimes gutfield or experience um I can have everything lined up and I think oh this is a sure thing

and it doesn't work out that way it just rolls the other way and I can be the other way when in my gut I really don't want to take that trade but I know that technically I've got to take that tra because it feels like I'm going against the overall Market sentiment at certain times
(1:30:37) and yet they become the best traits so yeah the ones that sometimes I think are going to be the best trades don't turn out to be and then the ones that I don't even want to put it on but you just know that you got to um because you got to follow what I'm doing your fits your criteria your Strat so you have to do it and then you look for me I'll look back a month later and say yeah that was yeah it was that was that was the right entry point but um are you someone who's um like strictly mechanical with your trading no no um discretionary um I'm taking in like I've already
(1:31:13) mentioned s market sentiment is important to me I think Market sentiment in gold right now is quite getting quite interesting because it's getting all the attention right now so it's starting to I've got you know some some views on gold who I'd love to see it get to 3,000 in the not too distant future we've got seasonality is on its side at this time of year as we're coming into the end of the year but it concerns me that there's a lot of chatter towards gold at the moment out there so when that when that happens it doesn't necessarily mean a Top's imminent right now but
(1:31:48) it starts making me look at you know that it may need a pause soon that's interesting Goldman wanted to go to 3,000 JP wanted to go to 3,000 go 3,000 we know what happens after that don't we cuz that's what they said when it got to 2,000 yeah yeah so I think there's plent there's plenty of that going on Plenty of that going on I think is is it's out there and um yeah yeah I've reckon it will get there I think the full away from 3,000 yeah yeah uh it's just getting it's I get nervous when there's every article out there is talking about gold it was no different in 2011
(1:32:28) no when all the gold Ki were propping up in your aage yeah Shopping Center yeah that was that was yeah and I remember I was actually I was on a a webinar at the time um around that time and I said I think Gold's topped and I got absolutely slated by the retail out there because they didn't have crypto back then they they were all into gold and um and they were you know slay to me for it it had already topped it was about month after the highs that had been made and I and I was listing off all
(1:32:59) the sentiment at that time I said it's just way too frothy and and then I said the the very fact that you're all brating me saying that Go's going to $5,000 and all this I said gives me even more reason to short and then they're going even more nuts at me at that point but so sentiment to me is uh is an important gauge in at certain times in the market and I think Gold's going to be really interesting actually I think you're right it's like it's like the Sho what's the Sho shine boy story the old uh the stock broker as he went and got his shoes shined by the same kid every day
(1:33:34) or whatever and then one day the shoes shine kid said should I be buying the stock market and he went oh [ __ ] it's time to sell it something like that is it's an old Story the young man just been the bunker H you ever the bun H Brothers yeah of course yeah bun H Brothers when they're trying to call silver market and the old man said I remember walking getting out Fur Street and walking down there bloody people queuing up out side Jewelers really with the family silver really trying to
(1:33:57) sell it I mean and that was that's an amazing occurrence that happened there yeah it's a big signal well that was the thing the old the old man said because he was trading LM actually had a silver contract then wasn't as big as the Buller market and comx and stuff like that but they wanted to be involved and he was trading silver as well and he said that was one of the most craziest things I've ever seen when comx changes its own rules you cannot buy silver in the spot month on margin didn't say you couldn't sell it didn't say you could sell it on margin so that was just
(1:34:35) BOS crazy crazy you'll have to reconvene this in a couple of months and see what where gold went where it currently 2,998 yeah well if we're all doing it from a beach from m b we' be all right that's it what are your thoughts in terms of risk because there is a lot of uh debate it's very interesting anytime that anyone on the podcast or generally out there talks about Dynamic risk a lot of retail Traders and a lot of General sentiment is ah you're a gambler if you use Dynamic risk um and bear in mind that

(1:35:13) they never say in terms of dynamic they never specify like I'm talking 20% 30% risk they're just saying Dynamic that's all and um I know some really good professional Traders most of the professional traders who have verified track records say that Dynamic risk is really important to them to get the big returns and doesn't mean that they can't be profitable with with static risk or fixed risk but the dynamic nature when they have that Gut Feeling Again going back to that gut feeling um and they feel that that's that AAR setup to size into that trade allows them to
(1:35:43) create those you know much higher return years and months Etc um what are your guys thoughts do you guys have like more static risk or dynamic risk or what's your thoughts around risk stasic risk for me because I know always know where we am yeah I think if you start to change your risk then you open yourself up to more risk because if the trade's going against you [ __ ] it i' got to give it a bit bit more room bit more room the way that I do it is a hedge so I don't give a [ __ ] that way he goes but do you know what I mean that would be if if that was me I would using a dynamic
(1:36:15) risk model that could get you in a [ __ ] load of trouble because like you said nobody wants to be wrong yeah so it's when are you going to admit that you got that called totally wrong is is it when 20% of your accounts gone 30% of when your accounts gone how far are you going to let that go before you should be getting a call from the risk Department going what the [ __ ] are you doing but you I think as a retail Trader you have to be your own Trader you have to be your own analyst you have to be your own risk manager and I think that's a lot of people struggle with that because
(1:36:48) that's that's quite a few hats to take on isn't it actually I've known Bank traders who are really great you know did really well in the bank and then they thought right you know don't I fed up with the bank I'm going to trade from home and couldn't do it because they had all that there yeah that all that whole support system and then when you've got to do it yourself yeah really struggled yeah when you know that you're going to get a bollocking from the rist department and you can put your job on the line and it's not your money accountability and and it's not your money
(1:37:14) I still I do vary my risk um depending on uh what I'm seeing but it's not you know I've still got a stop loss in the market so you know I've still got an overall cut off but if I I so I work within a risk range there are certain trades I would rather just I I use the Expression dip mat toe in the water with so I'll dip mat toe in the water and then I'll build the position over a bit of time and then there'll be other trades where I'll just go at full risk Max risk straight off so I do vary
(1:37:46) my risk a bit so I but for most retail Traders I'd say yes static risk is probably better for them because if they're risking let's say 1% on a trade of their account on one trade and then 0.1 on another they they're bound to get it wrong the one that they risk 1% on will be a loser the one they they risk 0.
(1:38:13) 1% will be a winner never you know so I think it's something which earned the right to do that sort of thing I don't think it's something to do straight away that just with the style of trading that I do it's static but um you know you just get used to again everything that everybody said all all the way through you get comfortable stuff so you get comfortable with trade size I stick to the same trade size so the risk is very static one of the final questions for you all is um I think it's a very important one because I get it quite often uh from the general audience they'll ask they'll be quite the the common theme of asking what is the definition of edge what does
(1:38:46) edge mean within trading maybe it looks different to everyone so it' be good to go around everyone like what your thoughts are in terms of what is it what is the definition of creating or forming your Edge and an edge sorry and what would that look like to you an edge I don't think anyone's really gotten Edge I think you've either this going to sound like I'm a white prick um you either know what you're doing or you don't I think do you know what I mean i' you know what I ain't [ __ ] said

(1:39:21) it all day day I've said it twice I have to get you one your you sign it first yeah I Ain taking this one ni out um no but I mean an an age I don't know I think from because we've got real life experience and we've been on Floors it's not we wouldn't turn around and go oh I've got this age I've got this age it's experience for us yeah that someone else might say well that is your Edge then I suppose but because we've actually been there seen it and done it it's a different experience it's a different experience for Mr Jones or Mrs Jones or whatever um how do you find
(1:40:04) it difficult for me to say really difficult for me to say because it just BL I mean this is what nearly 31 years for me it's interesting you're not talking about we're not sitting here all leaping and talking about something technical as an edge my that's why I find my age but oh oh well you go well I mean I I my my my Approach is technical so so my Edge would be so simple it would be like yeah Gold's in a ball Trend when it pulls back I'll throw my my bits my tools on there and look for a support level and if the first one doesn't work and it hits my stop I'll try the next
(1:40:45) one and it's just simply a case of I'm expecting the bull Trend to resume and eventually I'll buy it and it'll turn it'll go up and I'll make some money that's it it's dead simple you see I would yeah but there's a there's a psychological wedge there because you've just said if I get stopped out I'll look for the next level and I'll go in again yeah your average retail Trader won't do that because my Edge is I would say is I've got so used to taking a kicking from the market over the last 25 years or so that I've got used to taking that so I can I can get back up after the Market's
(1:41:20) battered me and not react like like a normal Trader retail Trader would do so to me that's my Edge now because the next trade that comes along like you're just saying in in Gold there might well be lovely the the next you just got the next Trend based tra trade you got to take that next trade yeah and if you've just had a kick you just had a few losses yeah that's that's the edge yeah I'd add to that I think we have got an edge because I think we've got used to losing money for a long a lot longer period to losing money but you know what I mean it's not taking P it's
(1:41:59) not taking the piss out of anybody but it's just it's just because you keep your T-shirt yeah you still want one um we've survived we've lost money but we've survived and we bounced back we've done it for a long yeah a longer period of time and the other thing is as well I mean talking about losing money he's still on the trading floor now so I won't say his real name just give you his initials GC I remember him when I was at Ral he's our copper Trader right and he thought he was going to be Billy big bollocks right on the clothes yes he's Bugsy from Barkley's he goes a
(1:42:37) thousand no buy five s three s hour eight C and he lost a million quid in literally 10 seconds yeah wow right as a retail that would kill you m what did we do so pub now M do you know what I mean get over the pub and you can put your arm man somebody and go like he's going to [ __ ] need to be picked up a little bit here CU he knows his job's on the line you know what I mean everything like that so it's yeah but that's getting he then has to get back in that ring after doing his bollocks
(1:43:19) yeah and he's got to do his job that's true yeah actually that's a that's a flaw thing because I I could give you two or three stories where I've really there was an an election back in the early '90s and I think Labour was supposed to win and they didn't and the Tories got in I got we got in early obviously CU it was going to be a big one and uh my clerk came up to me I think the market opened at 7:00 it was earlier open because of that the clerk comes up to about 10: to 7 because you've got an out trade from yesterday and I was like what I looked at it [ __ ] I'm down 100 Grand
(1:43:49) and the Market's not even opened I had to call my boss in Chicago like Roger I'm down 100 and we've not even opened yeah so I suppose three decades later I'm I'm still trading yeah and that's that's the thing I think you just I think that that is the different thing that you you have to get back in there you can't not trade yeah you have to do your job yeah is there any position just to finish up on it's a bit of an interesting topic to finish up on but off the back of that is there any

(1:44:18) sort of uh characteristic or you know scenario where you think people if they're not making those changes or not yeah not making changes and they keep making the same mistakes that they should just quit they should just quit trading because I know a lot of people don't talk about it um but I think it is important because I think a lot of people get Miss sold trading nowadays maybe even in the past as well uh but especially nowadays in terms of a certain lifestyle a certain way of trading a certain um lifestyle it will bring that trading will bring
(1:44:47) and therefore they get caught up in that Vision when in reality it's not like that like hopefully people tuning in today will hear a reality of trading you know um yes we've talked about some Highs but we' really talked about the reality of the journey yeah but most people don't hear that because they just by themselves and all they've seen is like a YouTube ad or an Instagram ad well there's that isn't the FCA is also coming out now and clamping or cracking down on CBS promoting things you know what I mean and and stuff like that and I guess in a social media
(1:45:17) world you're GNA have that in front of your face all the time it's just it's goingon to put those pre-c connotations in your mind about oh this is what it must be like and it must be all this and it must be all that I mean yeah if you do well in a city you get paid you get paid to do your job but you know it's it's a job it's not a it's not a it's not a lifestyle is it I suppose you know what I mean you you didn't walk into the city going I want a Ferrari I want a yacht if it happened for
(1:45:51) you it happened for you if you did well you were good at your job you'd get it but if you if you weren't and definitely you two can ATT tested that how many people did you just see turn up couldn't do it and went Lots yeah loads you think you have to love trading like you have to love the the art of the markets the that buzz of seeing you know the movements and the fundamentals and all the different moving Parts you have to actually enjoy that passion I think you have to hate it right but
(1:46:21) still come back to it and go you bastard and I'm going to I'm I'm going to do it this time I think you have that's the thing love it yes but you have got to love it if you don't love it you won't you won't come back the following day you got to be passionate about people get into it for the flashy and the cars and all the stuff that they see these days on social media and I understand everyone gets into the markets to make money initially but you've got to learn to be passionate about
(1:46:48) them youve got to enjoy it like a hobby or like a sport or whatever it is cuz if you don't like just said when the market gives you a kicking you are not going to come back so you got to and if you're not passionate about it you might as well go and do something else absolutely true yeah I think yeah it becomes an obsession um I can't imagine waking up one morning and not knowing where various different markets are and having a day where I just didn't know where something was can could you couldn't do that could you no we had that conversation earlier where we were
(1:47:15) talking you know it doesn't leave you I've got a question for you too just quick do you still have dreams about being on the floor I do I mean not real dreams about being on cuz I blood I do I do and they're always bad dreams honestly they are honestly they're always bad dreams I literally had one last week I dream that I I've don't know what my position is I can't get my clerk to run a run a position off yeah and yeah stuff like that yeah yeah see I don't dream a lot anyway so that's but I did used to have a dream in prison when I was there sleeping on the floor and I'd
(1:47:54) wake up in a cold sweat at night and somebody had turned up from bearings in London and said look we found the 58 account really it's okay don't do it again really you did it again you did it again in the dream in the dream you did it again because but there was a stage wasn't there where you actually got it all back there was yeah and then you were like within 250 Grand of it or something you and you could have walked away from it yeah yeah it just wasn't strong enough to walk away from it at time well I mean that was remarkable to have got it back to almost zero

(1:48:24) he really was cuz I still have them I still have them I just and I wake up and I think probably have one tonight yeah prob I think they they're good but you know what I mean I mean I had one I can't have a good one where I make a fortune and I go and buy that Ferrari I yeah I had one the other week and I was I was complaining to the G are standing next to me oh [ __ ] Acoustics are [ __ ] in this yeah I if anything think properly middle of a dream but no I just wondered cuz I thought is
(1:48:51) it just me I think that one was you just getting deaf yeah probably in the old age that's a sign Mrs keeps telling me the same thing that' be that would be lucky because you've got a a newborn on the way the being a bit deaf might be an advantage yeah yeah I got away with it with the last two as well any final questions for each other at all anything prop to mind uh blimy yeah favorite Pub favorite p in the city in the city you were at delgate Hill wouldn't you so what would have been yeah or do you remember fuos fuos yeah I didn't go there much but I do remember it that
(1:49:36) was yeah was not the go-to place to go was it that was every College press that was the one life it was the closest one actually good story so we moved from the Royal exchange to Cannon Street yeah and I don't think anyone in the area of Canon Street knew that we were moving so we've we've we've all you know we've gone up one day all the jackets so of course you know it's like right beer let's go and find a pub so everyone steamed into this place called the college press yeah and it was probably fairly quiet before we all turned up and this guy Frank lovely guy Frank he haded
(1:50:06) that and the cafe next door he had no idea that this exchange was coming in with 3,000 drunks yeah and uh I tell you what I bet he made more money than almost every Trader on the floor yeah I mean you imagine the LIF La moving in next door and you're the closest bar yeah and and and Cafe I bet he made him absolute Fortune yeah yeah we had a few lovely guys as well lovely guy we had a few of them I remember the first Pub my dad took me into in this city it was the wine Lodge on fenur Street it was opposite where the mark it when it was on fenur street and my initiation into
(1:50:39) who are all of these people because it literally just take me down there for the first day and so we're down upstairs and the downstairs we were all downstairs and there must have been about hundred of us first suit everything right first TI shoes everything's all prim and proper and this fell who I would later learn was Chris do come running down from upstairs with a bar store on his head right and the ceiling came down as you came down the stairs the ceiling came down low he's come running down Bast all smashed into the ceiling he's Let It Go he's come and
(1:51:17) he come running down the stairs and have a guy called Trevor they'd been out and on the a little afternoon and I remember looking at him and I thought he's a [ __ ] who's that and the old man's having a beer at the bar and he's ning away and then he makes a bee line for me and he goes who are you then I said uh my name's Paul I'm I'm Harry son and he went right young man pick me up by me jacket and he goes now this is in the '90s right so we know what air styles were right right in the 990s he goes I got one word of advice for you young man I was like right you
(1:51:59) a't get your [ __ ] haircut and then put me back down again and me dad is standing there watching pissing himself laughing and he comes over and he went well on son he saids you've been doed on day [Laughter] one best [Laughter] pup don't know really I I mean when I was when I was at baring Securities we just used to go to the minies a lot yeah yeah minies yeah was a Friday that was a Thursday night was there one called the cheser cheese as well ches cheese yes yes yes simos did you ever go to simos Simpsons yeah yeah yeah Simpsons Simpsons yeah St Chase no I don't

(1:52:41) know that one Stew Chase on Cor used do a craw every day no just all the bars you know that the audience is going to have a list now it's going be have come a thing when they visit closed it's a city institution it's opened in 1747 there's a big legal battle going on at the M even older than us yeah just about just about but no Che Simpsons yeah there's illegal I've seen that yeah yeah I think it's yeah Green tracked in the life group how man lived in there I think it's time I think it's time well an absolute pleasure thank you all for being here today it's been amazing amazing
(1:53:19) conversation I know I kept you all nice and cold in our he's cold hope you bring in some cold beers in now then well we has we we'll talk off camera but everyone thank you for tuning in a huge thank you as well to all of our guests Charlie Burton Jason sen Paul Scott and Nick Leon their links will be in the description below so make sure you check those out I'm looking at the wrong camera I just realized um but hit subscribe other episodes are on screen and until next time take care

**Jason Sen** began his career in the options pits on the trading floor of LIFFE in 1987 at the age of 19, making markets on his own account. In 2001 when the trading floor closed he successfully made the transition to day trading on computer screens. Jason used technical analysis throughout his trading career and formed Daytrdeideas.com which established itself as the leading provider of daily technical analysis to independent and professional traders within the investment bank community. He advises dozens of traders at up to 15 major investment banks and hedge funds on market movement throughout each trading day on The Bloomberg Professional® service and provides trade ideas with entry, exit and target levels in daily reports published before the Futures markets open in Europe.

**Profile**

**More Information**

Jason Sen, founder of DayTradeIdeas, began his trading career in the options pits on the ‘open outcry’ trading floor of the London International Financial Futures Exchange (LIFFE) in 1987 at the age of 19, trading a broad range of financial futures and options on his own account. In 2001 when the trading floor closed he successfully made the transition to electronic day trading. Trading the financial markets is all Jason has ever done, every day, for over 25 years!

Jason uses this experience to advise traders at some of the largest Investment Banks and is also the leading provider of daily technical analysis to the UK's professional day trading arcades. The exact same analysis that Professional Traders follow daily is now available to Independent Traders.

The trading sector is a great field for those who want to add an element of freedom to their professional life, but not everyone succeeds in following this path. Over the past 40 years, exceptional leaders like Jason Sen have reached new heights in their professions. He is the Founder and Technical Analyst at daytradeideas.co.uk and also the Co-Founder of Intelligent AI Solutions.
In this exclusive interview, Jason shares his career trajectory and opens up about the factors of starting and being a successful leader in this field.

Join us as we delve deeper into the mind and vision of Jason Sen, a revolutionary leader marking a change in the field of trading.

**The Beginning**

We were eager to learn about Jason Sen's start in this profession. So, we asked, "Can you walk us through your professional journey, highlighting key milestones that have shaped your career?"

Jason said, "*I started my career in financial markets in 1987 at the age of only 19 years in the City of London financial district. I was hired as a trainee derivatives broker for a merchant bank, working on the floor of the London Stock Exchange. The traded options market was growing rapidly and I was immediately trained to take orders from other banks over the phone and give them to the dealers who executed the orders in the open outcry pits.*

*In 1988 I was lucky enough to move to an independent market-making company on the same trading floor where I was trained to take risks and run positions. To me, this was an opportunity to earn an unlimited salary as my deal was performance-based. However, it took me over 2 years before I began to become profitable in such a highly competitive industry, where you stand shoulder to shoulder and fight to trade with the broker.*

He added, "*In the early 1990s I moved over to the intense trading environment of the London International Financial Futures Exchange. This was where complex fixed-income futures and options were traded (derivatives), such as government bond contracts in several open outcry pits. There were thousands of traders and brokers in brightly colored jackets, all shouting and using hand signals to trade frantically and aggressively.*

*Every day was filled with adrenaline-fueled risk-taking relying solely on my guts and lightning reactions. My mind was constantly making fast calculations as I screamed across the pit fighting for trades. At the turn of the millennium, I made the transition to screen trading as the trading floors closed and digital trading was born.*

*In 2007, I established my business daytradeideas.co.uk to provide technical analysis and signals for major investment banks. I now provide these services as well as education and training to retail traders who can benefit from my experience of almost 40 years trading in financial markets.*"

**Spark Behind The Profession**

We also wanted to know more about his decision to be in the field. So, we further asked, "What was the driving force behind your decision to join this sector?"

Jason added, "*In my teenage years I simply wanted an exciting career and the potential to earn a lot of money, like many teenagers! In the 1980s the Internet didn't exist so a career in financial markets in the City of London was one of the few opportunities to fulfill my dream.*

*I was inspired by my father who was one of the original day traders, trading from home with his funds. He would build charts of the FTSE100 on his office wall using a pencil & graph paper in the early 1980s because technical analysis software did not exist. Home computers barely existed. I was lucky to join the financial markets when they were growing and developing very rapidly.*"

**On Being A Successful Leader: Jason Sen**

Curious to gather Jason Sen's insights on what it takes to be a successful industry leader, we inquired, "In your opinion, what qualities make a successful leader in your industry?"

Jason shared, "*There are several elements that build a good industry leader, including:*

- *Exceptional self-discipline; the most successful traders control their reactions and emotions.*
- *Patience in building a trading strategy and the ability to make a plan for each trade, according to the rules of the strategy and stick to it.*
- *The most successful traders do not trade spontaneously. They plan every trade and adhere rigidly to the plan to build a data set which then allows them to optimize the strategy.*
- *The more trades you have, the greater the opportunity to optimize the strategy.*

**Adaptability To The Recent Developments**

Eager to delve into the trading journey of Jason Sen, we asked, "How has your organization responded to the ongoing digital revolution and tech-driven changes?"

He passionately shared, "*I began trading in 1987 when analog trades were executed in an open outcry trading pits, on a trading floor and the trades were recorded by each counterparty using a pencil and card!! So I have adapted through over almost 40 years of trading to the modern technological age.*"

**Words Of Wisdom For Beginner Traders**

Addressing the beginners in the field of trading, we asked, "What advice would you give to someone just starting in your field?"

Jason shared, "*If one can become successful at trading it can lead to a life where you are free to make your own decisions and choices. It allows you to travel the world or make significant sums of money. However, the path to success is long and frustrating. There's no shortcut.*

*There are 3 important steps to succeed in this field. Firstly, you must learn to identify trends and low-risk trading opportunities as the first step in developing a robust trading strategy. However, building the ability to identify great trade ideas is only the start*."

He further added, "*Secondly, you must then learn to exercise strict trade management, risk management, and account management techniques to limit losses and maximize gains. Following these rules is the only way to build the discipline and patience required for longer-term success. And thirdly, once you understand the rules of trading you must master trading psycholog*

*The best traders in the world have spent a long time mastering their trading psychology to eliminate the emotional roller coaster that leads inexperienced traders to sabotage their account which leads to severe setbacks*."

**Worth-Sharing Piece Of Wisdom**

Lastly, to learn about a piece of advice that has stayed with Jason Sen forever, we asked, "As a parting thought, what's the best piece of career advice you've ever received?"

"*The first cut is the cheapest. Get out of your losses while they are still under your control and move on to the next trading opportunity. This allows you to avoid spiraling into a negative mindset and avoid sustaining large losses*." Jason concluded.

STOP GAMBLING in Trading: 10 Golden Rules from a 40-Year Veteran Trader - YouTube

https://www.youtube.com/watch?v=gCAJTQbw3jU

Transcript:
(00:00) I've been a day trader for nearly 40 years I started in 1987 on the floor of the London International Financial Futures exchange and really I was quite a gambler in those days on the trading floor I soon learned to understand the key differences between day trading and gambling and I'm going to go through that with you today if you want to build a career in trading you've got to treat it as your business and not your hobby if you're trading for entertainment like when people go to the horse races or to the casino that's fine set a monthly
(00:30) budget and only risk what you can afford to lose go ahead have fun but if you actually want to make a living treat it as your business trading can be simple so use common sense make a wellth thought out plan and execute it rigidly ensure you preserve your capital and do not risk losing it all in a short period of time or in just a few trades you cannot make a profit if you do not stay in business keep control of your emotions one of Warren Buffett's most famous sayings about investing is rule number one let never lose money rule
(01:05) number two never forget rule number one and this rule applies to trading SO trading is different from gambling in many ways if you bet on a horse race or the roll of a dice the turn of the cards a spin of a wheel there's a clear start and end of the bet there are only two outcomes you win or you lose you already know exactly what you could lose or what you may win at the end of the game once you place your bet you know when the game or the race or the match ends and when the next one starts however a Trader is the one who decides when the
(01:37) BET starts because that's when you enter the trade the markets trade constantly from Monday morning to Friday night the trader must decide when the trade ends that's usually when the trade hits the stop loss or the target if the trader is adhering to strict trading rules however some Traders are forced to exit the trade by the broker when they receive a margin call because they've lost heavily even when the market is closed overnight or on the weekend the game is still being played if you have a position open
(02:06) in between the start and the end there are endless predictable and unpredictable potential outcomes the trader can win or lose almost any amount of money of the amount of money in the trading account within that time no one else will stop the game for you as a Trader unless you run out of margin and you lose everything only you decide this is exactly why you need to exercise complete discipline by setting your stop- loss and your target as you enter the trade you are defining the length of the trade and removing your emotions
(02:35) from the decision process by doing this professional gamblers are professionals because they understand the game and how to use the tools at their disposal to maximize their chances of coming up short for example poker players study theory and practice strategies to improve their games Market Watchers know when to enter or exit a position depending on what happens within the price sports fans understand the strength and weaknesses of each team so they can bet on the right side of the odds to be successful as a day trader
(03:05) though you need to know about the markets and the psychology of buying and selling here are a few key differences that can help you day trade without gambling firstly have a trading plan it's important to have a clear plan in place before you start trading secondly develop an entry and an exit strategy so you do not trade spontaneously third learn risk management techniques in gambling the amount of money you can lose is limited in day trading it's important to have strict risk management techniques in place to protect your

(03:36) capital and ensure your losses are limited fourth key to risk management is learning how to position size and stop loss correctly okay thanks for watching my video today we're going to go through the 10 golden rules of day trading that I've established over nearly 40 Years of trading the first one is never risk more than 2% of your trading capital in a single trade but all always risk the same amount on every trade because you don't know which trades will work and which trades will not secondly only execute trades where the profit
(04:10) potential at your Target price is greater than the potential loss or the point at which you place your stop loss when you enter the trade three always enter a stop loss when you enter the trade number four as well as setting a stop loss on each trade set a daily loss limit on your account so for example will never lose more than 5% in a day and quit trading for the day if you hit this limit number five set a daily Target and quit trading for the day if you hit this target or at least dramatically reduce your risk on each
(04:46) trade to ensure you keep the majority of the profit for that day setting targets and sticking to them allows you to clearly monitor your success rate number six keep a journal of all your trades keeping notes on what you did right and what you did wrong how to improve review your trades regularly at least once a week number seven never move your stop-loss price further out to potentially increase the loss the only direction in which you should move a stop- loss is in the favor of the trade as it moves further into profit to
(05:21) protect those profits number eight never let a profitable trade run into a loss whenever possible move your stop loss quickly to break even to give yourself a free no risk trade opportunity number nine never average into a losing trade in the hope that the market will suddenly turn around and reverse it's better to exit a trade and wait for the next opportunity than get married to one idea and nurse a losing trade holding on to a losing trade for longer than necessary it drains your energy your confidence and the funds in your account
(05:57) and it means that you're missing other potential profitable trades lastly number 10 run your profits and cut your losses but do not confuse this with being greedy use trailing stops to protect your profits exit your trade when your targets are hit holding on to a trade too long can stop you spotting and entering other potentially profitable trades

10 Forex trading rules for success. (From over 35 years of trading). - YouTube
https://www.youtube.com/watch?v=gk0fRNsQUTs

Transcript:
(00:00) my name is Jason saying if you don't know me I started trading on the London Stock Exchange floor in 1987 when I was 19 years old about three years later I moved over to the London International Financial Futures exchange and I traded in the open outcry pits there until the end of the decade I moved over to trading on the screens where no markets went digital other than doing that ever since about 35 years that I have been involved in the factory markets over the last 15 years I've been providing signals and technical analysis to Banks
(00:30) and independent retail Traders when I started there were books about trading but you know videos and no courses nothing online anyway so you were thrown in the trading pit with your own money and you had to learn really quickly very much by trial and error I ended up writing loads of

books for my own benefit so that I can remember all the rules I've just decided to release them for free for my YouTube followers in the description box below click the link to receive the series of ebooks for free you'll also get an opportunity to book a
(01:02) free Mentor call with me book it up and we can talk about ways that I can help you improve your training it's all free no charge it'd be interesting for me just to meet people and see how you're getting on in this video I'm going to cover my golden rules of trading made every mistake in the book over and over again I did just wake up one day and be the perfect Trader I unfortunately learned trading the hard way it really is a struggle and it does take years you can't master a skill like this I say master I wouldn't say I've mastered it
(01:31) you can't become a consistently profitable Trader without making a lot of mistakes and learning same with every profession so I've written my golden rules of trading the first one is actually do your own research and make your own decisions now that's probably quite a funny first rule from someone who provides a technical analysis and signals service do not enter a trade without proper research study your technicals if you if you want to learn technical analysis talk to me I can teach you I've written a course it
(01:57) covers all the basics and all the techniques that I've learned over 35 years of trading you need to understand why you have entered the trade not why someone else is recommending that you enter a trade you must set a budget for how much to risk on each trade your risk must be in proportion to your reward I recommend risking one percent to try to make two percent you must use a stop loss and you must never move the stop loss further away from the entry point don't run losses by moving your stop-loss further away from your entry
(02:23) price set a daily win Target for the day and the same with a lost you have a maximum loss that you're prepared to take for the day so if you've done three or four trades they've all gone wrong you've hit your maximum stock for the day just walk away clear your mind get ready for the next day that way you you're protecting your downside and you're going to be in a position where you're mentally ready to trade the next day and obviously financially ready because you haven't blown a massive hole in your account the amount you're
(02:49) prepared to lose in one day should be less than the amount that you're prepared to win do not average into a losing trade purely because your position is losing and you can't bear to take a loss and you think the Market's going to reverse it's not a winning strategy if your strategy is to average into a trade across a price range and I do recommend that I do that myself that's fine but don't average into a losing trade just because it is losing then you don't want to take the loss and you think eventually you'll be right
(03:12) don't lose more than a day then you intended to make if your target is to make 200 in a day don't go and lose 300 that's going to put you in a hole and it'll take you too too long to make it back don't let the good profit turn into a loss so let's say you're risking 15 Pips to try and make 25 Pips if you've got up to 20 Pips you're getting close to your target don't allow the market to just turn around and then hit your stop Trail your stop up manage the position make sure you at least come out of the trade with say seven eight Pips in profit the
(03:42) market may actually return to your entry point may give you a second chance after you've taken a small profit don't enter a trade if you're unsure of the trend I'm a trend follower following a trend is one of my key points I go into that in my course actually but to identify the prevailing Trend and trade in that direction don't go against the trend don't close trades without a good reason I've done this the market might be going the right direction but it may not have moved for two or three hours you get bored and you exit the trade
(04:06) um don't do that make a plan and trade that plan and wait for your edvo stop or your target to get make sure you do have a Target if you get into a trade you don't really know where you're going to exit you're never going to be satisfied with where you get out even if you do make a really

nice profit and if the market continues going in the direction of the trade after you've got out you're going to be kicking yourself you need to have a Target again you need to have a point at which you are satisfied that you have made a good amount of money and
(04:28) you're prepared to move on to the next trade so you must have a Target set in order to be satisfied with the result of the trade never cancel your stop loss and always training in the direction of profit keep the size under control and keep the number of Trades under control don't trade spontaneously stick to the plan so these are some of the ideas I have in my golden rules of trading ebook please just click on the link in the description box below sign up for my series of ebooks book a free Mentor session with me and we can have a chat
(04:56) about your trading and try and find ways in which I can help you to improve

How to Build a Profitable Trading Strategy | Professional Trading Guide (40 Years Experience) - YouTube
https://www.youtube.com/watch?v=oqCtY84eC_U

Transcript:
(00:00) So, you've decided that you want to become a professional trader. You want to be successful at this. You want to learn how to make consistent profits. You probably started off by being a scalper. You probably followed some guru who told who taught you how to scalp. And you probably really enjoyed that. It's quite intense.
(00:19) You probably sat in front of a screen or in front of your phone in out in out taking money. Uh maybe doing dozens of trades every day. But eventually, you'll have realized that that isn't something that you can do in the long term. scalping is too intense. It requires too much focus. So, you decided to learn about financial markets.
(00:37) How do they work? How do they move? You probably got quite obsessed with it. Trading has to really be an obsession if you want to be successful at it because it does require so much focus and energy. And if you've got to that stage where you've decided to move on to the next level, how do I actually become a professional trader? How do I actually build a strategy? When you first started your scalping, he didn't realize that you had to actually build a strategy.
(01:03) You can't just trade randomly and spontaneously in order to make consistent profits. You actually have to develop a strategy of how to tackle the markets, how to deal with them, how to understand is the market trending, how to understand how markets move, and what strategy you're going to employ to take advantage of those movements. And different strategies work in different conditions.
(01:27) So a trend following strategy, you're looking for markets that are either moving up or moving down. A scalpel strategy, you're basically looking for markets that are moving sideways in a consolidation or a channel or a triangle or a pen, some sort of sideways consolidation pattern. But anyway, if you've got to that stage now where you're ready to move on, people come to me at this stage and say, "Right, I want to get serious.
(01:49) I really don't know what the stage is." I'm going to tell you now what you need to do. The first thing you need to do is devise an entry strategy. How am I going to actually enter a trade according to a criteria so I can repeat that success? So you need to have an entry strategy in order to do that.

(02:07) So you know what you're looking for. You know you're looking for a specific setup. You're not just jumping in because you think it might go up and hope for the best. I use technical analysis to identify low-risk trade opportunities. And there are many different techniques. technical analysis alone will take you months to experiment with because there are so many different tools and indicators and so many different approaches.
(02:31) So that alone will take you months to figure out what works for you. You'll start by throwing everything at your chart. You'll just litter it with all sorts of indicators and oscillators and trend lines and moving averages and then slowly you'll cut it back when you realize you just can't see the wood for the trees with how much information is on your chart.
(02:50) It's analysis paralysis where where every single price on your chart looks like a trade opportunity. Then you'll start to scale it back. You'll start to remove stuff that doesn't work. And finally, you'll come up with something that looks a lot more simple on a chart and something where you can actually identify, okay, here, this could be a point where the market might reverse.
(03:13) I'm going to try buying it here. And if I'm wrong, I've got a stop-loss strategy. and if I'm right, I've got an exit strategy where I'm going to manage the position and take my profit. Once you've got to that stage, you you're not even halfway to becoming a professional trader. You then need to figure out how you're going to manage the trade, manage your risk, manage your accounts.
(03:39) All of these are really important so you don't blow a big hole in your accounts and that you build your profits steadily. That's stage two for me. You're still not ready to be a full-time professional trader who's making consistent profits. You then have to go through the whole psychology of trading because no matter how good you are in your technical analysis, no matter how good you are at identifying low-risk trade opportunities and managing the trade and making sure that you don't take too much risk and that you manage your account and that you
(04:11) don't overtrade, you then have to tackle things that will come into your head like FOMO, fear of missing out, revenge trading, overtrading, and undertrading, not having and the confidence to execute a trade when you've been through two or three losses. This is all about trading psychology and learning how to deal with those emotions, deal with the negative thoughts, deal with the panic, the anxiety, the overconfidence as well and that feeling that you've mastered it because as soon as you do that, the market will teach you very quickly that
(04:43) you don't. So there are so many stages and so many different parts of building successful strategy and managing it and controlling yourself in order to become consistently profitable. If you want more advice on how to do that, please post a question in the comments and I'll try and help you move forward on that whole process.
(05:05) But what I'm trying to say to you is don't rush into this. There is an awful lot of work to do. Trading isn't simply a case of opening an account, putting 500 pounds in, and and then building that up slowly. There is so much work to do. This is why 90% of traders actually fail. Okay, I hope you found this useful. If you have, please like, share, and subscribe.
(05:24) And don't forget, give me your questions and comments, and I'll get back to you as soon as I can
