For mispronounced words, there's a built-in fix in AI Studio: double-click any problem word in the script editor and select "Pronunciation", then type the phonetic version using hyphens for syllables (e.g., "a-eye" for "AI").

For technical terms or names that consistently cause issues, the Brand Glossary lets you pre-set pronunciation rules that apply automatically across all your videos: https://help.heygen.com/en/articles/8830251-how-to-use-brand-glossary

VO: " "

“I Blew Accounts for Years… Then These 10 Rules Made Me Consistently Profitable”

“Stop Doing This in Trades: My Non-Negotiable Rules (Learned the Hard Way)”

VO: "My name is Jason Sen. I have been a trader since 1987, and today I want to explain my Golden Rules of Trading.

I Learned these the Hard Way, through trial and error. because when I started 40 years ago, there were no mentors like myself to teach me. There was no rule book. No Youtube videos to teach us. In fact there was no internet.

Floor trading had only just started in London. Online trading did not exist. In fact few people even had a home computer, and smart phones did not exist.

We threw ourselves into the trading pits and learned through our losses & profits.

OK so in this video I’m going to give you my *golden rules of trading*.
And I’m not saying this from a textbook… I’m saying it as someone who’s made **every mistake in the book**. Repeatedly.

I didn’t wake up one day and become a “perfect trader”. I learned the hard way. And trading *is* a struggle. It takes years.
And honestly… I still wouldn’t say I’ve “mastered” it. But I have become consistently profitable — and these rules are a big reason why.

So if you want fewer stupid mistakes, fewer blown accounts, and more consistency… listen to this all the way through.

Rule number one.

Do your own research. Make your own decisions.

Now… this is going to sound funny coming from someone who provides technical analysis and signals.

But I mean it: **don't enter a trade without proper research.**
You need to understand *why* you're in the trade — not just that someone else said "buy here".

Study your technicals. Understand the trend. Understand the levels. Understand what would prove you wrong.

And yes — if you want to learn technical analysis properly, talk to me. I can teach you. I've got a course that covers the basics and the techniques I've learned over decades.
But either way… the point is: **you must own the decision.**

Rule number 2.

Set your risk *before* you enter.

This one is non-negotiable.

You must set a budget for how much you're prepared to risk on each trade.
And your risk must make sense compared to your reward.

A simple structure I like is: **risk 1% to make 2%**.
Not because it's magic — but because it forces discipline.

And that leads into the next rule…

Rule number 3.

Always use a stop loss — and never move it further away.

Always use a stop. Always.

And whatever you do — **do not move the stop loss further away from your entry** just because you don't want to be wrong.

That one habit has destroyed more accounts than bad analysis ever will.

If your stop gets hit, fine. That's business. That's the cost of trading.

But don't turn a planned small loss into a big one because your ego can't take it. "

VO: "Rule number 4

Have a daily win target *and* a daily max loss.

This is how you protect your mindset — and your account.

Set a daily target for the day… and also set a **maximum loss** for the day.

So if you've done three or four trades, they've all gone wrong, and you've hit your max loss… **walk away.**

Clear your mind. Reset. Come back tomorrow.

Because if you keep trading after that, you're not trading your strategy anymore — you're trading your emotions.

And here's a simple principle:
The amount you're prepared to lose in a day should be less than the amount you're prepared to win.

Rule number 5

Don't average into a losing trade out of pain.

A lot of traders do this.

They're in a losing position… they can't bear to take the loss… and they start adding to it because they *hope* the market will reverse.

That's not a strategy. That's desperation.

Now — to be clear — if your strategy is to scale into a trade across a planned price range, and it's part of your system, that's different.

But don't average in **just because it's losing** and you want to avoid admitting you're wrong.

Rule number 6

Don't lose more in a day than you intended to make.

This sounds obvious… but people break it constantly.

If your daily target is, say, **£200**… don't go and lose **£300**.

That puts you in a hole, and then you spend days trying to "get back to even"… and that's when people start forcing trades.

Protect your consistency. Protect your momentum.

Rule number 7.

Don't let a good profit turn into a loss. Manage the trade.

Let's say you're risking 15 pips to make 25 pips.

If you're up 20 pips — you're close.
Don't just sit there and let the market turn around and hit your stop.

Trail your stop. Manage the position. Lock something in.

Even if you come out with 7 or 8 pips profit — that's still a win.
And sometimes the market will come back to your entry and give you a second chance anyway.

But turning a strong trade into a loss because you didn't manage it… that's painful.

Rule number 8

Don’t enter if you’re unsure of the trend.

I’m a trend follower. That’s one of my key principles.

Identify the prevailing trend — and trade in that direction.

If you’re not sure what the trend is… don’t trade.
And definitely don’t go against it just because you think you’ve found “the top” or “the bottom”.

That’s how people get chopped up..”

Rule number 9

Don’t close trades without a good reason.

I’ve done this one too.

The trade is going in the right direction… but it hasn’t moved for two or three hours… you get bored… you exit.

Don’t.

Make a plan. Trade the plan.
Let your stop or your target do the work.

Boredom is not a signal.

Rule number 10.

Always have a target — otherwise you'll never be satisfied.

If you enter a trade and you don't know where you're going to exit… you'll always mess it up.

You'll take profit too early… or too late… or you'll watch it go further after you exit and you'll be kicking yourself.

You need a target — a point where you're satisfied you've made a good amount — and you're ready to move on.

No target = no structure.

Before we get on the final & most important rules, please hit subscribe so you get my daily technical analysis and trade signals, plus more trading education.

My last rules are. Never cancel your stop loss.
Control size.
Control frequency.

Never cancel your stop.

Keep your position size under control.
Keep the number of trades under control.

Don't trade spontaneously. Don't trade emotionally.

Plan your trade… and trade your plan.

If you want to learn the technical side properly, trend, levels, entries, trade management and trade psychology that's exactly what I teach.

Have a look in the description box below for details.
But even if you don’t use my stuff, take these rules seriously.

Because they’ll save you years of pain.

“You’re Not Bad at Trading — Your Brain Is Sabotaging You (5 Reasons)”

“If You Break Your Own Trading Rules, Watch This: 5 Human Traps Killing Your Results”

Here's 5 Reasons why you Self-Sabotage Your Trading.

Let me tell you something that might save you a lot of money.

Most traders don’t fail because they don’t know enough.

They fail because they self-sabotage.

And the frustrating part is, it’s not because there's something wrong with you. It’s because you’re human.

So in this video I’m going to break down five reasons why you and I are both pre-programmed to sabotage our own trading strategy. and what you can do about it.

Here's the first reason.

Emotional bias. That's when fear and greed hijack the plan.

Even if you've got a solid strategy, emotions can override it in seconds.

Fear makes you cut winners early.

Greed makes you hold on too long.

And panic makes you do the worst thing of all. Improvise.

You start moving stops, chasing entries, and revenge trading. Then suddenly you're not trading your system anymore. You're trading your feelings.

And feelings don't have an edge.

I know you and I have both done this. I am certain every trader has, at some stage in their career.

Here's reason two.

Cognitive biases. This is when your brain lies to you.

This one's sneaky, because it feels like "logic".

Two big ones you need to understand here.

Confirmation bias. This is when you only look for information that supports what you already want to believe.

So if you want the market to go up, you'll find reasons it "should" go up. And you'll ignore the one reason it won't.

But of course you do not know that you are doing this.

And it's particularly difficult with technical analysis. Because you can make a chart tell you anything you want. In fact if you show the same chart to three technical analysts, you could get 3 different opinions.

It's really tough to remain impartial. Especially if you have read something that has subconsciously given you an opinion on direction.

For example, you read that Gold could go up because inflation is expected in increase...and now you are looking at your chart and seeing reasons why it could go up. Instead of just doing unbiased technical analysis to look for low risk opportunities.

This is one reason why it is best to do your analysis when you have no open positions.

And then there's overconfidence bias. When you start thinking you're better than the market.

Has this happened to you? It happened to me in the early days. And I thought I needed to be confident when I started trading. To have the confidence to execute trades, take on risk, so that I could make big profits.

But I took on bigger size, I took lower-quality setups, and I broke rules.

because I felt invincible.

That's usually right before the market humbles you. The market always punishes over confidence...even now after 40 years of trading.

And then you suffer a huge loss, which sets you back weeks, maybe even months.

Not just financially but mentally. You lose financial capital, but also mental capital.

It takes a lot of energy to recover from both so it's so important to spot when you are experiencing an overconfidence bias.

You need to recognise when you start to feel over confident. And devise measures to stop yourself trading. So you can calm down. Get your feet back on the ground.

Before you suffer serious losses. Or before you blow a funded account.

If you are finding this video helpful, please hit the subscribe button.

Now let’s move on to reason 3.

We all know that a lack of discipline can lead to trading disasters. But what does that actually look like?

Sometimes it is when boredom and impatience destroy consistency.

Discipline sounds simple, but it’s hard in real time.

Because trading has a lot of waiting.

And when you’re waiting, your brain starts looking for entertainment.

You start to think to yourself

“Maybe I’ll just take this one quick trade…”

or

“This looks close enough so I will jump in now…”

or

“I don’t want to miss the move…”

That’s how people drift away from a good strategy.

A trading plan only works if you actually follow it. Religiously. Especially on the boring days.

I teach my traders one important lesson.

Plan your trade and trade your plan. Make that your focus.

OK reason 4.

You hate taking losses. Of course we all do. So you turn small losses into big ones.

We used to say on the floor that a trade turned into a longer term investment, because you've lost so much that you have no choice but to hold it, and hope for the best.

Of course that is not a trading strategy.

Humans are naturally loss-averse. We hate being wrong.

So what do traders do?

They hold losing trades too long.

They avoid using stop losses, because that is an instant admission that the trade could lose money.

They do not want to face that fact, especially if the risk on the trade is more than it should be.

So they move the stop further away just as it is about to get hit, to buy more time.

Be honest. This has happened to you hasn't it?

They tell themselves: "It'll come back."

But the market doesn't care what you need it to do.

And this is where accounts get damaged or prop accounts get blown.

Not by one loss. But by one loss that turns into a disaster, because you refused to accept it.

A professional trader takes the loss quickly and moves on to the next opportunity.

An emotional trader negotiates with the market.

Before we get on to reason 5, If you want to learn the technical side properly. How to identify trends, Low risk entry levels, trade management, risk management, trading psychology hacks, that's exactly what I teach.

Have a look in the description box below for details. You'll also find my contact details if you would like to chat.

And please visit my website daytradeideas.co.uk

OK let's get on to Reason 5.

I want to talk about herd mentality. Fear of missing out makes you abandon your edge.

This is the crowd effect.

You see a big move. Everyone’s talking about it. The chart is flying. You think everyone is making money except you.

And you feel that pressure. You think “If I don’t get in now, I’m going to miss it.”

That’s FOMO.

Does that sound familiar?

And when you trade, because everyone else is trading, you’re not following your strategy.

You’re following the crowd.

And the crowd usually shows up late. Right near the turning point.

The fix is this. awareness plus rules plus risk management.

So what do you do with this?

You don’t try to remove human nature. You build a system that protects you from it.

Strict risk management.

Clear rules for entries and exits.

A stop loss you never cancel.

A daily max loss to protect yourself from blowing your account. And this also helps to ensure you walk away from a bad day, ready to start again tomorrow, without destroying your confidence.

You do not want a bad day to turn into a bad week.

And you need the discipline to only trade your best setups.

Because the goal isn’t to be perfect. The goal is to be consistent.

Very few people get rich quick from trading and if they do it is probably just down to good luck.

The best traders I know have built wealth over time. Showing up every day and keeping it under control.
They know it's important to be able to fight another day.

If you've ever broken your own rules and thought, "Why did I do that?" you're not alone.

But once you understand why humans self-sabotage, you can start building habits that stop it.

"I See Traders Make Money by 11am… Then Give It All Back (Here's Why)"

"Overtrading Is Not a Strategy — It's Self-Sabotage (Stop Doing This After Lunch)"

"Overtrading & Revenge Trading (How to Stop Blowing Good Mornings)"

We're going to talk about **overtrading** and **revenge trading**. because after speaking with a few of my subscribers, I can tell you, this is a major problem for a lot of traders.

And the scary part is this.
It often happens to people who actually *can* trade.

They're good at analysis. They spot low-risk opportunities. They start the day disciplined, and then somehow, by the end of the day, they've given it all back.

If that's you, listen carefully, because this video might be the difference between a good month and a blown account.

Let me give you a real example.

One subscriber I spoke to is genuinely good at spotting trade ideas.
He's done my course, his analysis is solid, and in the morning he starts out focused and disciplined.

He'll do two or three trades early on, and he'll make a decent profit.

But this is where it starts to go wrong.

It's like he loses control.
Maybe it's greed. I think it's overconfidence. Maybe it's just the buzz of being "in the zone".

But the structured trading disappears, and it turns into gambling.

And I think what's happening is he gets **absorbed by the market**.

Does that happen to you?

Think about your own routine.

You switch your machine on in the morning, you do your analysis, you're calm. You're not too emotionally involved.

But after a few trades, you become more absorbed.
You start watching every price move.
You start watching your P&L tick up and down.
Everything feels more intense.

And once it gets intense, that's when overtrading starts.
And once overtrading starts, revenge trading is usually not far behind.

If this all makes sense to you, please hit subscribe so you can catch my signals videos, where you can copy my trades, and also learn from more trading education like this.

VO: "The key skill is knowing when *not* to trade

Here's the truth:

Successful traders don't just know when to enter a trade.
They know when to **stop**.

Knowing when not to trade is just as important as knowing when to trade.

It doesn't matter if it's only lunchtime.

If you know you can't trust yourself to trade in the afternoon… **don't trade in the afternoon.**

That's not weakness. That's professionalism.

This is what it comes back to:

Plan your trade. Trade your plan.

And part of "the plan" is knowing what state you need to be in mentally to execute properly.

So here's what I want you to watch for as the day goes on:

- Your discipline starts slipping
- Your patience starts slipping
- Your anxiety rises
- You're staring at the screen more
- You're obsessing over P&L
- Your emotions get bigger — either overconfidence or fear

If you notice that happening, you need to be able to say:
"Right. I'm not in the right frame of mind. I need to stop."

Here's A simple rule that can change everything

You might need a rule like this.

I don't trade afternoons.

If you can do two or three good trades in the morning… and you can finish with two winners out of three… you've had a great day.

If you can do that consistently and finish at lunchtime, there is absolutely nothing wrong with that."

VO: "Ask yourself honestly:

Can I trust myself to trade in the afternoon?
Or am I the kind of trader who does well in the morning… and gives it all back later?

Be honest. Because your results already tell you the answer.

Time-of-day matters more than people realise

And here's another thing to consider.

If you're trading European hours, conditions can change in the afternoon.

When the US market opens, things can become more volatile, more aggressive, sometimes more unpredictable.

Maybe in the morning you're good with steady moves.
And in the afternoon it becomes choppy, and you can't handle it.

So you start doubting yourself.
Second-guessing.
Changing your mind mid-trade.
Over-managing.
Overtrading.

So you may need to say:
At these periods of the day, I shouldn't be trading.

Before we go to the most important point of this video, If you want to learn everything I have learned about technical analysis, to identify low-risk trade opportunities, and also trade management, risk management, and my trading psychology hacks, Have a look in the description box below for details."

VO: "OK so let me tell you that Great traders **Put guardrails on their trading day.**

And Here are two guardrails that work for a lot of traders:

Firstly they use A trade limit

For example they decide: I only take 3 to 4 trades per day.

Secondly they use a profit target. They decide: When I hit my target, I stop.

When you hit your limit. Stop trading.
When you hit your profit target. Stop trading.

Professional traders know that protecting their profit is as important as minimising their losses.

Because being a day trader does not mean you must trade all day.
It does not even mean you trade every day.

In fact the goal is not to trade all day. If you are doing that, you may have a gambling addiction problem!
The goal is to make money consistently and protect your mindset.

There's nothing wrong with stepping out of the market.

In fact, it's one of the best habits you can build. because the most important thing is that you start the next morning feeling confident.

If you've had a good morning, made decent money, and you stop for the afternoon, that's a win.

You wake up the next day thinking:
I feel good. I'm in control. I trust myself.

And that's the lifestyle you want as a trader.

Because trading done properly should feel structured… calm… almost boring.

Plan your trade. Trade your plan.**"**

Heygen Video Script: “The 3 Things You Must Master to Become a Successful Day Trader”

1) **“If You’re Missing ONE of These, You’ll Never Be Consistently Profitable (3 Day Trading Skills)”**

2) **“Stop Guessing. Start Trading Like a Pro: The 3 Things You Must Master”**

VO: "If you want to become a successful day trader, there are three elements you must master.

And if you’re missing even one of them, you might still have the odd good day, but you won’t become consistently profitable.

Because consistent profitability isn’t about guessing direction.

It’s about building a skillset, step by step, until you can execute without emotion.

Let’s break it down.

I am Jason Sen. I have been a trader since 1987 and I have been trading traders and providing daily technical analysis & signals for over 20 years.

OK the first element is technical analysis. Ok this is obvious because most traders are technical traders. You must learn how to identify trends and low-risk trade opportunities.

This is the first step in building any robust trading strategy, by developing the ability to identify low risk trading opportunities.

Because if you can't read the market properly, you're always going to feel uncertain.

And uncertainty leads to hesitation, or impulsive trades, and both are expensive.

I have simple trend following techniques, using just 5 technical analysis tools:

Fibonacci lines, trend lines, moving averages, patterns and price action.

I use technical analysis to identify my stop loss levels & my targets too. They are not just random numbers thatI choose because I want to risk less than I hope to make.

If the technical levels do not line up to meet my risk vs reward strategy, I can't take the trade.

I never jump into a trade just because I think it might go up or down. Each trade must pass my 5 point technical check list."

VO: "The second element is what most traders ignore until it's too late.

Strict trade management, risk management, and account management.

They are important because you can be the best technical analyst in the world, but if you do not understand these principles you will fail.

These 3 elements ensure you limit losses and maximise gains.

And I'm sure I don't need to explain why that matters.

This is also how you build the discipline and patience required for long-term success.

Because without risk management, even a good strategy can wipe you out.

And without trade management, you'll constantly turn good trades into average trades, and average trades into losses.

Now the third element is the one that catches people out.

And before we start, if you're finding this helpful, please help me by hitting that subscribe button.

The best analysts in the world can still fail as traders if they don't master themselves.

This is trading psychology.

If you don't control your emotions, you'll live on that emotional roller coaster:

- fear

- greed

- overconfidence

- anxiety

- revenge trading

- overtrading

And that's how inexperienced traders sabotage their accounts and suffer massive setbacks.

The best traders in the world have spent a long time mastering psychology so they can execute calmly.

The goal is to trade without emotion, follow rules, and build a real dataset over the longer term.

It definitely is not about snatching quick, random gains."

VO: "Only once you've got these three elements working together can you build a robust strategy and become consistently profitable.

And here's the key point:

When you combine strict risk management with discipline and patience, you can trade without emotion.

Only then can you trade consistently — sticking to the rules — and build up a reliable dataset of trades.

That's the holy grail for traders. It's not finding a magic strategy. Which I assure you does not exist.

Your strategy & the system needs to be repeatable.

Then you build more & more confidence in your execution over months & years. Until eventually you trade without any emotion.

The wins or losses mean nothing. You're just running your trading business and you know that at the end of the month, there will be a decent profit in your account.
You know you will have losses, but they are just a business cost and they do not bother you.

They do not make you question your ability to trade.

And this is where most people miss the whole game.

Before we go to the most important point of this video, if you're finding this helpful, please hit subscribe.

And if you want to learn everything I have learned about technical analysis, to identify low-risk trade opportunities, and also trade management, risk management, and my trading psychology hacks, Have a look in the description box below for details.

Or visit my website daytradeideas.co.uk "

VO: "Here's Why 100 trades matter.

After 100 trades of sticking rigidly to the 3 elements on every trade, you can analyse your results properly.

You can fine-tune and optimise your strategy based on evidence, not feelings.

You might discover things like:

Your stop-loss is too tight.

You're taking profit too early.

You need to hold trades a little longer.

Your position size is too big.

You're risking too much on certain setups.

And as you analyse that dataset, your confidence grows. Because you can see the strategy working over time.

Most importantly, you start to trust your strategy, and your ability to stick to it without losing discipline

That's when you're ready to build your account long-term.

Now, does this sound like a long, boring process?

Good. Because it is. ".

VO: "The amateur approach is guessing where to enter, hoping you're right, and gambling on the direction of the markets.

Most traders think they can just guess direction day in, day out.

They jump into trades spontaneously.

They hope they're right.

They only take a loss when the pain becomes unbearable.

And they take profit by guessing when it "feels like the right time".

No plan. No structure. No exit strategy.

If that sounds like your trading strategy, you need to stop. NOW.

Because you don't know what you're doing.

You’re gambling & hoping things go well."

VO: "Here's why gambling never builds confidence

The amateur approach leaves you confused and dissatisfied.

Even when you make money, you don’t feel satisfied. Because deep down you know it was luck.

And you’ve got no idea whether you can repeat it on the next trad, or over the next week. Or the next month.

That gambler never builds real confidence.

He never learns discipline and patience.

And eventually he gives up, usually after blowing the account, and wasting months, sometimes years.

Years that could have been spent building a real strategy and real experience.

So choose your path

If you understand what I’ve said in this video, you’re in the right frame of mind to build a trading career.

If you want to keep gambling, that’s fine. It's your money.

But don’t pretend to yourself that you’re building skill and experience."

Heygen Video Script: “How to Enter, Exit, and Manage Trades (Without Emotion)”

“Stop Chasing Entries: The Simple Trade Management System That Keeps You Profitable”

“If You Feel Nervous in a Trade, You’re Doing THIS Wrong (Entry, Stop, Target Rules)”

VO: "This is a practical guide to help you **enter trades**, **exit trades**, manage the trade while it’s open — and most importantly, **manage your account**.

Because most traders don’t lose money from “bad analysis”.
They lose money from *bad execution*.

And I want to start with one of the most common problems I see…

I am Jason Sen. I have been a trader since 1987 and I have been trading traders and providing daily technical analysis & signals for over 20 years.

OK starting with Part 1.

The entry mistake that costs traders a fortune.

Do you ever fear the price won’t hit your entry level?

You’ve done your research. You’ve done your analysis. You’ve picked your entry price…
…and then you sit there watching the market move up and down.

And eventually you jump in early, *before* it reaches your level — because you’re scared you’ll miss the move.

That is chasing.

And chasing is how you end up entering at the worst possible price.

So here's the rule:

Wait for the correct entry point. Don't chase the price.
You must be prepared to miss a trade by a small margin. It will happen. Accept it.

Because if you can't accept missing a trade by a few pips, you will continuously enter at unfavourable levels.

And here's the irony:

Very often the market gives you a second chance anyway. It retests the level, to give you another chance to try the trade. "

VO: " 'Now on to Part 2.

Risk the same amount every single trade.

Let me ask you a question:

How much of your account do you risk per trade?

My rule is simple: **risk the exact same amount on every trade.**
Because you never know which trade will work and which won't.

And I'll be honest. even after nearly 40 years, I'm still surprised sometimes by which trades win and which trades don't.

So consistency in risk is what keeps you stable.

A good guideline:
Risk no more than 2% of your account per trade.

And ideally, for most people learning, even less.

Because the only way to avoid being emotional is when the money at risk isn't big enough to cause you pain. "

VO: " Part 3.

Stop losses. Set them when you feel nothing.

Next question:

Do you set a stop loss when you enter the trade?
or do you try to stop out manually when you can't take any more pain and you panic?

If you're stopping out manually, you're letting emotion control the exit.

My advice is this:

Set the stop loss the moment you enter the order.
Because that's when you're calm. You're analytical. You can think clearly.

Setting the stop should be automatic, like putting your seatbelt on.

And one more thing:

Do your analysis when you have **no open positions**. That's the only time you have no bias. "

VO: "In Part 4 we look at identifying Trends plus low-risk entry plus targets.

Then leave it alone and let the trade play out.

Try to identify low-risk entry levels in the direction of the prevailing trend.

For example:
If you're in a bull trend, you look to buy at a support level.

Then you set your targets at the levels you identified in your analysis.

And then, this is important, you wait for the market to do the work.

Don't sit there watching every tick and watching your P&L go up and down.
Find something else to do while the trade plays out.

Because staring at the screen is how you start interfering with good trades. "

VO: "Part 5 is about Risk vs reward and how it only works if you stop chasing trades.

The only way to minimise loss and maximise profit is to use a sensible risk-to-reward ratio.

So for example:
Only risk 10 pips to make 15 or 20 pips.

But that's only possible if you wait for low-risk entry points.

If you get in too early, like buying above support because you fear missing out, you increase your risk and reduce your potential profit.

So you must accept this truth:

You will miss trades.
We all miss trades that would have made money.

You cannot catch every profitable move.

And you must never chase a trade as it moves away from your entry point. "

VO: "Part 6 is the real reason you feel nervous in a trade.

Before we get on to the most important parts, please hit subscribe so you get my daily technical analysis and trade signals, plus more trading education.

Now listen carefully:

If you enter a trade and you feel nervous, it's almost always because your trade size is too big.

It's not the fear of a losing trade.
It's knowing you can't afford the loss.

So if you're not relaxed when the trade is open, cut the size down.

If you're having sleepless nights… dreaming about open trades… checking your phone constantly…
you're risking too much.

You're not in control of your account.

And trading too big leads to revenge trading. It never ends well. I guarantee it, because I've done it myself many times.

You might get a huge gain at first, but eventually you'll lose everything.

Successful trading is boring.

It should be unemotional and robotic. "

VO: "In Part 7 I explain why small risk keeps you in the game.

If you manage risk properly, even if you have five or six losses in a row, you're only down around 10%.

That means you can continue trading without panic.
No desperation. No “I need to win it back today.”

And that’s how you stay consistent long enough for your edge to play out."

VO: "Part 8. Set your targets before you enter a trade. (or your exits will be emotional)

Before you enter a trade, set your targets based on your analysis.

Because if you don’t set a target before you enter… how will you know when to exit?

You’ll decide in the moment, and that decision will be emotional, spontaneous, and not based on analysis.

A plan first. Execution second.

Here’s what I teach my students. Plan your trade and trade your plan.

If you want to learn from a mentor with 40 years of trading experience from floor to screen trading, have a look in the description and get in touch. "

VO: "In Part 9, I’ll give you three clean ways to exit when targets are hit.

Here are three practical ways to exit when your targets are hit:

1. **Scale out of the position.**

   Sell one-third or one-half at the first target.
   This banks profit and reduces pressure.

2. **Trail your stop loss in the direction of profit.**

   So if the market reverses, you protect what you've earned.

3. **Exit in stages.**

   One, two, or three stages satisfies that urge to take profit, without closing the whole position too early. "

VO: "So to summarise. focus on habits first, money later

While you're learning to trade, it's really important to stick to the rules.

At this stage, it's not even about making money.
It's about building habits, discipline, patience, consistency, that will make you money in the future.

And when you can do all of this, you get an incredible feeling:

You trust yourself.

You can enter trades confidently without negative emotions.
You can accept a loss and move on to the next trade without hesitation.

That's what it takes to become successful at trading. "

Heygen Video Script: “How to Handle Trading Losses (10 Rules From 40 Years)”

1. **“How Pro Traders Handle Losses: 10 Rules That Stop You Revenge Trading”**

2. **“Lost a Trade? Watch This Before You Place Another One (10 Loss-Control Rules)”**

Let me teach you something that every trader has to learn. Whether they like it or not.

Handling losses is a core skill in trading.
Because nobody, and I mean nobody, makes profitable trades all the time.

If you can’t handle losses properly, you’ll either quit,or you’ll revenge trade, and blow your account.

So here are my **10 rules for handling trading losses**, based on nearly 40 years of doing this.

I am Jason Sen. I have been a trader since 1987 and I have been trading traders and providing daily technical analysis & signals for over 20 years.

1) Accept losses as part of trading

Losses are inevitable. They happen.

I’ve been trading for nearly 40 years and I still have periods where I’ll get a run of losing trades.

That doesn’t mean your strategy is broken.
It means you’re trading.

---

2) Don’t let emotions make decisions for you

After a loss, the danger isn’t the loss itself.

The danger is what comes next:
anger, frustration, embarrassment… and that urge to “fix it” immediately.

You must keep a clear head.
Because emotional decisions are nearly always expensive decisions.

---

3) Always use a stop loss (and set it when you enter)

Always use a stop loss.

A stop loss automatically exits you from a losing position at a price you chose *in advance*.

And if you rely on a manual stop — “I’ll just watch it and get out when it hits my level” — believe me, you will hesitate when the moment comes.

You’ll delay. You’ll hope. You’ll negotiate with the market.

A stop loss removes that.

---

4) Keep perspective: each trade is just one small part

One trade is not your career.

Each trade is one small part of a bigger plan.

So don’t let one loss discourage you, or knock you off track.

Your job is to execute the plan over a series of trades — not to be right on every single one.

---

5) Learn from your losses (you’ll learn more than from winners)

This is a big one.

Analyse your losing trades to understand what went wrong and how to improve.

Honestly, I've learned far more from my losing trades than my winning trades.

So don't treat a loss as "failure".
Treat it as feedback.

---

6) Have a risk management plan before you trade

You need a plan to manage risk — including:

- position sizing
- where your stop loss goes
- how much you risk per trade
- and when you stop for the day

If you don't have a plan, you're relying on emotion to protect you.
And emotion won't.

---

7) Don't gamble: wait for the right opportunities

Don't sit there watching the market and thinking:
"Oh it's moving… I better jump in."

That's gambling.

Professional trading is patient.
You wait for the right setup — and you accept that sometimes there is no trade.

---

8) Don't overtrade after a loss (avoid revenge trading)

If you take a loss, don't think:
"Right — I'm getting straight back in."

That's desperation.

That's revenge trading.

If you feel that urge, do this instead:
stop. step away from the market. calm down.

Because trying to "win it back" quickly is how small losses turn into big drawdowns.

---

9) Take breaks — not just when emotional, but when overconfident

Most people understand taking a break when they feel angry or frustrated.

But you also need to take breaks when you feel **overconfident**.

Because overconfidence usually leads to:

- bigger size
- lower-quality trades
- broken rules
  …and eventually a big loss.

So step away when your emotions are high — positive or negative.

---

10) Stay disciplined and build a dataset

Stick to your trading plan and your risk management strategy even when you're experiencing losses.

Because the goal is to build a **dataset** of trades you can analyse.

That’s how you improve.
That’s how you build confidence.
And that’s how you become consistently profitable over time.

[Close | 0:10–0:20]
Losses don’t destroy traders.

What destroys traders is what they do *after* a loss.

So follow these rules, protect your account, and keep your head clear.

If you want, I can also turn these 10 points into a simple one-page checklist you can keep next to your screen.

---

1. **“How to Take a Loss Without Blowing Your Account (40 Years of Hard Lessons)”**

2. **“Lost Money Trading? Watch This Before Your Next Trade (10 Rules to Stay in Control)”**

Heygen Video Script (≈6 minutes): “How to Handle Losses Like a Pro Trader (40 Years of Lessons)”

Let me tell you something that most traders don’t want to hear, but it’s the truth:
Your success as a trader isn’t defined by your winning trades. It’s defined by how you handle your losing trades.

I learned trading through trial and error over a 40-year career. I started in 1987, and it took me three or four years to become properly profitable. And one of the biggest reasons it took that long is simple — I didn't know how to handle losses.

Unfortunately, I took too many large losses over the years. Painful ones. And that's how I learned the lessons I want to teach you today.

And I'll also share what I've learned from training traders for the last 25 years — because the patterns are always the same.

So if you've ever taken a loss and then immediately made it worse… this video is for you.

1) Accept losses are part of trading]

First rule: **accept that losses are part of trading.**

Losses are not a sign that you're "bad". They're not a sign that trading "doesn't work".
They are an inevitable part of the job.

Even with a good strategy, you will have losing trades. You'll have losing days. Sometimes you'll have a run of losses.

The goal is not to eliminate losses.
The goal is to make sure your losses are **small, controlled, and planned** — so they don't damage your account or your mindset.

Because if you expect to win all the time, every loss feels like a shock… and that's when people start doing stupid things.

2) Don't let emotions control the next decision]

Second rule: **don't let emotions control your decisions.**

After a loss, your brain goes into a very dangerous state.
You feel frustration, anger, embarrassment, sometimes even panic.

And that emotional state creates one big urge:
"I need to make it back right now."

That's the moment traders stop following their plan.

So here's what I want you to do after a loss:
Take a step back. Take a deep breath. Slow everything down.

Even 60 seconds is enough to break the emotional loop.

Ask yourself:

- "Am I calm?"
- "Am I thinking clearly?"
- "Or am I trying to fix my feelings with another trade?"

Because if you're trying to fix emotions with trading… you're not trading anymore. You're gambling.

3) Use stop-loss orders (and why manual stops fail)]

Third rule: **use stop-loss orders. Always.**

A stop-loss is an order that automatically exits the trade at a price you choose in advance.
It's there to protect you from the one thing you can't trust in the moment: *your emotions.*

A lot of traders say:
"I'll stop out manually. I'll watch it."

But when price gets close to that level, you hesitate.
You start hoping.
You start thinking: "Just a bit more… it'll turn."

And that hesitation is how a small loss becomes a big loss.

So set the stop when you enter the trade — when you're calm and analytical — and then let it do its job.

4) Keep perspective: one trade means nothing

Fourth rule: **keep perspective.**

Each trade is just one small part of your overall plan.

One loss doesn't matter.
Even a few losses don't matter — if your risk is controlled.

What matters is your performance over a series of trades.

This is why professional traders think in probabilities.
They don't need to be right on the next trade.
They need to execute well over the next 50 or 100 trades.

So don't let one loss knock you off course.

5) Learn from losses (you learn more than from winners)

Fifth rule: **learn from your losses.**

I can tell you from experience: I learned far more from losing trades than I ever learned from winning trades.

Winning trades can make you lazy. They can make you think you're brilliant.
Losing trades force you to look at the details.

After a loss, ask:

- Was my entry according to plan?
- Was I trading with the trend?
- Was my stop in the right place, or was it too tight?
- Did I take a low-quality setup out of boredom?
- Did I increase size because I felt confident?

A loss is not failure — it's feedback.

And if you collect that feedback properly, you improve fast.

6) Have a risk plan: position size + stop placement

Sixth rule: **have a plan to manage risk.**

This is where traders either survive long enough to succeed… or they don't.

Your risk plan should include:

- how much you risk per trade
- how you calculate position size
- where your stop goes
- and when you stop trading for the day

And it all needs to be in proportion.

If you risk too much, every trade feels like life or death.
And when trades feel like life or death, you will not trade calmly.

Small, controlled risk keeps you stable. It keeps you thinking clearly. It keeps you in the game.

---

7) Don't deviate from the plan after losses

Seventh rule: **don't let a few losing trades push you off your plan.**

This is a common trap.

You take two or three losses and you start thinking:
"Maybe my strategy doesn't work."
So you start changing rules mid-week, mid-session, mid-emotion.

That's not strategy development — that's panic.

Stick to the plan long enough to get real data.
Then you adjust logically, not emotionally.

8) Don’t overtrade to make it back

Eighth rule: **don’t overtrade.**

After a loss, the temptation is to trade more.
More trades, more risk, more “chances” to get it back.

But overtrading usually means lower-quality setups, worse entries, and bigger mistakes.

If you feel the urge to “win it back”… that’s your signal to stop.

9) Take a break — reset your state

Ninth rule: **take a break.**

Step away if you feel emotional.

Go for a walk. Get a coffee. Do something that changes your state.

And here’s something people forget:
Take breaks when you feel **overconfident** too.

Overconfidence leads to bigger size and sloppy trades — and that’s when the market hits you hardest.

10) Stay disciplined — this is the whole game

Tenth rule: **stay disciplined.**

Stick to your trading plan and your risk management strategy even when you’re experiencing losses.

Because discipline is what creates consistency.
And consistency is what creates profitability.

Trading done properly should feel structured… calm… almost boring.

And that's a good thing.

If you found these tips useful, please like, share, and subscribe.

I'm going to keep making these videos to help newer traders build real skill, avoid the painful mistakes, and improve step by step.

1. "About to Quit Trading? Watch This — The Cycle That's Wiping Out Your Account"

2. "If You're Trading on Hope, You're Gambling (Here's the Pro Process to Get Control Back)"

Heygen Video Script (≈7 minutes): “If You’re About to Quit Trading, Watch This”

[0:00–0:25 | Opening / Authority + empathy]
Hi, I’m Jason Sen. I’ve been a trader for nearly 40 years.
And I’ll be honest with you — there have been many times throughout my career when I’ve been ready to quit. Properly ready to quit.

So if you’re at that point right now… if you’re thinking, “I’ve had enough”… watch this to the end. Because I can help you.

Not with hype. Not with promises.
But with the truth about what’s actually going wrong — and the exact process you need to follow to get control back.

[0:25–1:25 | Why most new traders get crushed]

If you’re inexperienced, it’s very easy to believe trading is a quick fix.

You think:
“I’ll do a bit of analysis, I’ll guess direction, I’ll jump in, and I’ll make quick money.”

So you see a move starting… and you jump into a trade because you’re scared of missing the opportunity.

But then the market does what it always does — it moves around.
And you realise you should’ve waited.

You haven’t thought properly about how much you’re risking.
You haven’t decided where you’ll cut the loss.
And now you’re in the trade… reacting.

If the trade goes against you, you start panicking and praying it reverses.
If it goes in your favour, you take profit too quickly because you’re scared it’ll reverse.

And then you regret it when price continues in the direction you expected.

That emotional swing — fear, relief, regret — that’s the start of the cycle.

[1:25–2:25 | The greed trap: no target = no control]

Then greed kicks in.

Because you didn't set a target when you entered the trade, you start making it up as you go.

You start looking for reasons to stay in longer:
"This could be a big one… this could run… I don't want to get out too early…"

So you hold too long.

And eventually — because markets don't move in straight lines — price reverses.

And you freeze as you watch your profit evaporate.

That moment right there is where a lot of traders mentally break.
Because you realise: "I don't actually have a plan. I'm just hoping."

[2:25–3:20 | "Trade watching" and the paralysis problem]

This is what inexperienced traders do — and I used to do it too for years.

They trade spontaneously.
No plan. No structure. No stop loss. No targets.

And then they sit there watching every pip.

It's called **trade watching**.

You're glued to your screen, watching price go up and down, watching your P&L go up and down.

And here's the worst part: even if the trade starts to recover… even if the loss gets smaller… maybe it even goes into profit…

You still can't make a clear decision.

Because you don't know what you're doing.

Do you cut it now while it's a small loss?
Do you hold for break-even?
Do you hold for profit?

You're paralysed. Confused. Emotional.

And confusion is expensive.

[3:20–4:15 | How small losses become account-ending losses]

Eventually the loss can become so large that you can't face it.

You can't face pressing the button and making it real.

So you hold on… and it becomes worse.

And now it turns into an "all or nothing" trade.

You're risking the whole account just to try to break even.

And then one of two things happens:

- You finally can't take the pain and you exit with a massive loss…
  or
- You lose everything and the broker closes the position for you.

And that's not trading. That's a slow-motion car crash.

[4:15–5:10 | What happens after the big loss: two bad paths]

So what happens after a big loss?

For some people, confidence is destroyed.
You can't even process how it happened. Trading feels dangerous. So you quit immediately.

For others — if there's any money left in the account — you get angry.

You blame the market. You blame the news. You blame "manipulation".

But the truth is: it wasn't the market.

It was lack of planning and lack of discipline.

And that anger leads to **revenge trading** — one big uncontrolled gamble to make it all back in one trade.

And that usually leads to another huge loss… often wiping out the account completely.

[5:10–5:45 | Even a lucky win can trap you]

And here's another trap people don't talk about.

Sometimes the revenge trade actually works. It ends in profit.

So the trade is "saved".

But what happens next?

Uncontrolled excitement. Overconfidence.
You become desperate to repeat that feeling.

So you jump into another unplanned trade — again with no risk assessment, no clear exit strategy.

And the cycle continues.

Win, excitement, overtrade.
Loss, anger, revenge trade.
And round and round it goes.

[5:45–6:55 | The correct procedure: how pros build consistency]

So what is the correct procedure to build consistent profits?

I’m going to give it to you as a checklist. And if you do these steps, you’ll start to feel in control again.

1) Learn one proven strategy

Learn at least one trading strategy that’s proven to work over a large sample size.

Not a “tip”. Not a “signal”. Not a social media opinion.
A strategy with rules that can be repeated.

2) Learn to analyse markets to find low-risk opportunities

Learn to analyse markets properly so you can identify low-risk setups.

And stop searching for recommendations online.
Especially on social media.

Most of it is noise — and noise makes you impulsive.

3) Build an entry strategy

You must know exactly **how, where, and why** you enter.

Not “because it’s moving”.
Not “because I feel like it’s going up”.

A real entry plan that minimises risk and stops you from overtrading.

4) Always place a calculated stop loss

Before you enter the trade, you should know exactly what you lose if you’re wrong.

And the stop loss should be placed according to analysis rules — not based on what you *want* to risk.

If the stop needs to be wider, you reduce the position size.
That’s how professionals do it.

5) Always set targets

Set targets for the trade — more than one if your strategy allows scaling out.

Targets stop you getting greedy while the trade is open.

6) Plan the entire trade before execution

Every trade should be fully planned before you click the button:

- entry
- stop
- targets
- position size
- risk management rules

This eliminates impulsive, spontaneous trading — which inevitably leads to losses.

[6:55–7:20 | Close: what trading should feel like]

It’s only by following a proven strategy and sticking to strict rules that you can expect consistent profits — and feel fully in control of the process.

Professional trading should be planned, unemotional, and even boring.

And if you’re trading for entertainment, that’s fine — just be honest with yourself: you’re gambling, like a casino.

But if you want consistency, you need structure.

[Optional CTA]
If this helped you, like, share, and subscribe — and tell me in the comments: what’s the biggest thing that makes you want to quit trading? I’ll make a video on it.

---

1. **“I Started as a Gambler on the LIFFE Trading Floor… Here’s What Finally Made Me Profitable”**

2. **“Day Trading vs Gambling: The 10 Rules That Stop You Blowing Your Account”**

Heygen Video Script (≈7 minutes): “Day Trading vs Gambling (What I Learned on the LIFFE Floor)”

[0:00–0:25 | Hook + credibility]
When I started trading in 1987 on the floor of the London International Financial Futures Exchange — LIFFE — I was basically a gambler.

That’s what I thought trading was.
Guess direction… jump in… hope you’re right… and get out when the pain becomes too much.

That pain… was my stop loss.

And I learned very quickly that this is a disastrous way to trade.

So in this video I want to explain the key differences between **day trading** and **gambling**, what I learned from being around successful traders on the floor — and then I’ll give you my **10 golden rules** that I’ve built over nearly 40 years.

If you want to build a career in trading, this is one of the most important videos you’ll ever watch.

Trading as a business vs hobby]

First, you’ve got to decide what trading is to you.

If you’re trading for entertainment — like people go to the horse races or the casino — that’s fine.
Set a monthly budget. Risk only what you can afford to lose. Enjoy it.

But if you want to make a living from trading, you must treat it like a business — not a hobby.

Trading can be simple if you use common sense:

- make a well-thought-out plan
- execute it rigidly
- preserve your capital
- control your emotions

Because you cannot make a profit if you don't stay in business.

And one of Warren Buffett's famous sayings applies here as well:
"Rule number one: never lose money. Rule number two: never forget rule number one."

Now, obviously in trading you *will* have losing trades — but the spirit of that rule is: protect your capital first.

The real difference: gambling has an end, trading doesn't]

Here's a key difference between gambling and trading that most people don't understand.

If you bet on a horse race, roll of a dice, cards, roulette — there's a clear start and end.

Two outcomes: you win or you lose.
You know the maximum you can lose, and you know when the game ends.

Trading is different.

In trading, **you decide when the bet starts** — that's your entry.
And the markets trade constantly from Monday morning to Friday night.

You also decide when the bet ends — ideally when you hit your stop loss or your target.

But here's where it gets dangerous:

Some traders don't decide.
They refuse to take the loss… and they're forced out by the broker on a margin call.

And even when the market is closed overnight or over the weekend, if you've got a position open… the game is still being played.

Between entry and exit there are endless outcomes — predictable and unpredictable — and you can win or lose almost any amount of money in that time.

No one stops the game for you.

Unless you run out of margin and lose everything.

That's why trading without rules is so dangerous.

Why stops + targets remove emotion]

This is exactly why you need discipline.

You must set your **stop loss** and your **target** as you enter the trade.

Because when you do that, you're defining the length of the trade, defining the risk, defining the potential reward — and you're removing emotion from the decision process.

If you don't do this, your emotions will decide for you in real time.

And emotions are not a strategy.

"Even gamblers are professionals" point]

Now, even professional gamblers are professionals because they understand the game and use tools to improve their odds.

Poker players study theory and practice.
Sports bettors study strengths and weaknesses and odds.
Market watchers look for patterns and timing.

So if you want to be successful as a day trader, you need to understand markets — and you need to understand the psychology of buying and selling.

And you need rules.

Here are a few key differences that help you day trade without gambling:

1. **Have a trading plan** — a clear plan before you start
2. **Develop an entry and exit strategy** — so you don't trade spontaneously
3. **Learn risk management** — because in trading, losses can spiral if you don't control them
4. **Position sizing + stop loss placement** — this is the foundation of survival

Now let’s get into the golden rules.

The 10 Golden Rules of Day Trading

Rule 1: Never risk more than 2% per trade (and risk the same each time)

Never risk more than 2% of your trading capital on a single trade.
And always risk the same amount on every trade.

Because you don’t know which trades will work and which won’t.

Rule 2: Only take trades with positive risk-to-reward

Only execute trades where the profit potential at your target is greater than the potential loss at your stop.

If the maths doesn’t work, don’t take the trade.

Rule 3: Always enter a stop loss when you enter the trade

Not later. Not “I’ll watch it.”
When you enter — you set the stop.

Rule 4: Set a daily loss limit

For example: never lose more than 5% in a day.
If you hit it — stop trading for the day.

This prevents one bad day turning into a disaster.

Rule 5: Set a daily profit target (and protect it)

Quit trading when you hit your target — or at least reduce risk dramatically so you keep most of the profit.

Targets help you measure progress and stop you giving good days back.

Rule 6: Keep a trading journal

Journal every trade.

What you did right. What you did wrong. What to improve.
Review at least weekly.

This is how you turn experience into skill.

Rule 7: Never move your stop further away

Never move your stop-loss price further out to increase the loss.

The only direction you move a stop is **in your favour** — to protect profit.

Rule 8: Never let a profitable trade turn into a loss

Whenever possible, move your stop to break even to create a “free trade” opportunity.

Protect your capital and protect your confidence.

Rule 9: Never average into a losing trade out of hope

Never average into a losing trade hoping the market turns around.

It’s better to exit and wait for the next opportunity than get married to one idea.

Holding losing trades drains your energy, your confidence, and your account — and it stops you taking better opportunities.

Rule 10: Run profits, cut losses — without being greedy

Let profits run, cut losses quickly — but don’t confuse “running profits” with greed.

Use trailing stops to protect profit. Exit when targets are hit.
Holding too long can also stop you seeing the next good trade.

So that’s the difference between day trading and gambling.

Trading is a business. It’s rules. It’s risk control. It’s discipline.
And when it’s done properly, it should be planned, unemotional… and even boring.

Thanks for watching — and if you want, in the next video I’ll break down these rules with real examples so you can apply them immediately.

---

1. **“Trailing Stops Explained: How to Protect Profit Without Getting Stopped Out”**
2. **“Stop Moving Your Stop Too Soon (My Trailing Stop Method + 4 Alternatives)”**

Heygen Video Script (≈7 minutes): “How I Set Trailing Stops (Without Getting Stopped Out Too Early)”

[0:00–0:20 | Hook]
“How do I manage and set my trailing stops?”

This is a question I get asked all the time by my subscribers, so it’s about time I tackled it properly.

Because a trailing stop strategy is a key part of trade management.
When a trade starts moving in your favour and you see profit building, you need a plan to **protect that profit** in case the market reverses.

But the big mistake most traders make is trailing the stop **too aggressively**… and getting stopped out right before the trade actually does what they expected.

So in this video I’m going to show you how I do it — and I’ll also give you a few alternative trailing stop methods you can use depending on your strategy.

[0:20–1:20 | The core idea: don’t trail too aggressively]

The key for me is this:

I don’t trail the stop too aggressively.

Now, some traders move their stop to break-even as quickly as possible to create what they call a “free trade”.

And I understand the logic:
Worst case, you break even. No risk. Mathematically it makes sense.

But for me personally, I often trade using support and resistance.

So if I’ve bought at a strong support level in a bull trend, I see that entry as a gift — that’s my edge. That’s the low-risk opportunity.

So I don’t want to trail my stop straight back to the entry point quickly… because I don’t understand why I’d want to get stopped out at the exact level where I believed it was a great buy.

Now, if your entry strategy is different — maybe more momentum-based, or more random — then moving to break-even quickly might suit you better.

So the first decision you need to make is:
Do you want to trail aggressively… or do you want to give the trade breathing space?

[1:20–3:10 | My method: targets + staged stop movement]

So how do I do it?

I usually set **two or three targets** for the trade.

Stage 1: near Target 1 — reduce risk, don't rush to break-even

When price gets to the first target — or close to it — that's when I start thinking about trailing the stop.

But my first goal is **not** to move the stop to break-even.

My first goal is to **cut down the potential loss**.

So I might move the stop:

- halfway to my entry, or
- even three-quarters of the way to my entry

What does that achieve?

It means I've reduced the risk massively…
but if the market retests the entry level — which happens all the time — I'm not getting stopped out for no reason.

And if price breaks below the entry and starts heading lower, I'm out quickly with a very small loss.

That balance works well for my style.

Partial profit at Target 1

At the first target, I may also take partial profit.

And remember: if your trade is structured properly, by the time you hit Target 1, the profit should be greater than the original risk — because we always want to make more than we risk.

[3:10–4:20 | Stage 2: near Target 2 — lock in guaranteed profit]

Now the second stage is when we move toward Target 2.

Sometimes I take everything at Target 2.
Sometimes I have a third target.
Sometimes I'll decide not to bother with Target 3 depending on market conditions — candle formations, volatility, how clean the move looks.

But if I'm continuing the trade, then as we approach or hit Target 2, I'll move my stop **somewhere between the entry point and Target 1**.

Now, worst-case scenario, I'm guaranteed to make profit on the trade.

And here's a simple example:

- Take one-third profit at Target 1
- Take one-third profit at Target 2
  Now you're out of two-thirds of the position.

For the remaining third, you trail your stop so that even if price reverses, you still bank a bit of profit on that final portion.

This reduces stress massively — because you're no longer trying to be perfect. You're managing probabilities.

[4:20–6:40 | Alternative trailing stop strategies (choose what fits)]

Now, depending on your strategy, you might prefer a different trailing stop method. Here are four popular alternatives.

1) Percentage trailing stop

I don't personally use this much, but it can be great for swing trading — like stocks, indices, gold — where you might hold for days or weeks.

Example: market is at 1,000 and you use a 2% trailing stop.
If it drops 2% to 980, you're out.

As price rises, the stop trails at 2% below current price.

What I like about this is the stop widens in point terms as price rises — it gives breathing space.

2) ATR-based trailing stop (Average True Range)

Another popular method is using ATR.

If you're trading the daily timeframe and ATR is, say, 50 pips, you might set your stop at 60 or 65 pips — slightly outside normal daily movement.

Then you trail it as the trade moves in your favour.

The logic is: if price moves against you by more than normal volatility, something has changed — and you want out.

3) Price action trailing stop (swing highs/lows)

This is a clean one.

If you're long, look at the previous swing low on your relevant timeframe — for me often the 4-hour chart.

If price breaks that swing low, you question whether the short-term trend is still intact, so you exit.

In forex, you might place the stop 10 pips below that swing low, for example.

4) Technical tools: Fibonacci, moving averages, trend lines

This is closer to what I like.

If price breaks above a Fibonacci level and I'm in profit, I might trail my stop to just under that level — assuming it becomes support.

So I might place the stop 10, 15, maybe 20 pips below the Fib level.

If price breaks back below it, I'm out — because that can indicate a false break, and I want protection when the trade isn't behaving as expected.

And you can do the same with moving averages, trend lines, key support/resistance — whatever tools your strategy is built around.

[6:40–7:05 | Close + CTA]**

So that’s how I think about trailing stops:

- don’t trail too aggressively
- reduce risk in stages
- lock profit in stages
- and choose a method that fits your entry strategy

I hope you found that useful.

If you’ve got a trailing stop method that works for you, let me know in the comments — I’m always interested to hear different approaches.

And if this helped, please like, share, and subscribe.

1. **“Winning Streaks Will Blow Your Account (Overconfidence Is the Silent Killer)”**

2. **“6 Wins in a Row? Do THIS Next — The Mistake That Turns Winners Into Big Losses”**

Heygen Video Script (≈6–7 minutes): “Winning Streaks Are Dangerous (Overconfidence Destroys Traders)”

[0:00–0:25 | Hook]
When you’re on a losing streak, you know what to do.

You cut your size down.
You take a break.
You step away, clear your head, re-evaluate your strategy, and you start trading more carefully.

That’s normal.

But I want you to think about something most traders completely ignore:

What do you do when you’re on a winning streak?

Because an unusually good winning streak — six, seven, eight winners in a row — can be more dangerous than a losing streak.

And it’s usually when traders feel at their best… that they’re most vulnerable to a big loss.

[0:25–1:15 | The psychology shift: from cautious to cocky]

Here’s what happens.

You’ve had a great run. You’ve made more profit than you normally do.
And without realising it, your mindset shifts.

You start feeling:

- “I’ve mastered this.”
- “My analysis is perfect.”
- “I can beat the markets.”
- “I can’t put a foot wrong.”

You start feeling like the master of the universe.

And I’m not saying that to insult you — I’ve been through it myself many times over nearly 40 years.

Winning streaks can create a dangerous illusion:
that your recent results are proof you’re in total control.

But markets have a way of punishing that mindset.

[1:15–2:10 | Why you’re most vulnerable after wins]

This is the key point:

Overconfidence doesn't just change how you feel — it changes how you behave.

And those behaviour changes are what cause the big loss.

Because when you feel confident, you start relaxing the rules.

You stop doing the boring disciplined things that actually made you profitable in the first place.

So the question isn't: "Am I a good trader?"
The question is: "Am I still executing like a professional… or am I starting to gamble because I feel invincible?"

[2:10–3:25 | The common mistakes that appear during winning streaks]

Here are the most common things I see — and I've done all of them myself.

1) You start increasing size

You think: "I'm in the zone. Let's press it."
So you trade bigger.

And that means the next loss isn't a normal loss — it's a painful one.

2) You stop respecting stop losses

Maybe you still use a stop… but you start moving it.
Or you widen it.
Or you tell yourself: "I'll manage it manually."

That's when small controlled losses turn into big uncontrolled losses.

3) You stop taking profit properly

You start holding trades longer than normal because you want the "big one".

You don’t trail the stop when you should.
You don’t scale out when you normally would.

And then the market does what it always does — it reverses — and you watch profit evaporate.

4) You start taking lower-quality setups

This is a big one.

When you’re confident, you start thinking everything is a setup.

You start trading because you’re bored.
Or because you want to stay in the action.
Or because you feel like you “can’t lose”.

That’s overtrading — and it’s usually disguised as confidence.

[3:25–4:20 | The focus problem: when confidence becomes laziness]

Another thing that happens is you become less focused.

Not because you’re careless — but because you feel safe.

You stop doing the full analysis.
You stop waiting for the best entry.
You stop being patient.

You might even start multitasking, half-watching the market, thinking you’ve got it handled.

And the market loves to punish half-focus.

Because trading is one of those games where you can do everything right for a while… and then one moment of sloppiness wipes out days or weeks of good work.

[4:20–5:20 | The self-check: questions to ask yourself]

So you've got to be aware of this.

When you've had a strong run, ask yourself:

- **Am I being overconfident?**
- **Am I starting to lose discipline?**
- **Am I less focused than normal?**
- **Am I taking trades I wouldn't normally take?**
- **Am I increasing size because I feel unstoppable?**
- **Am I still using stops and targets properly?**
- **Am I trading my plan… or trading my mood?**

Because it's easy to recognise when you're losing confidence — when you're anxious, scared, stressed.

It's much harder to recognise when you're overconfident.

And that's why it's dangerous.

[5:20–6:20 | What to do: slow down, trade defensively]

So what should you do when you notice it?

First: **slow down.**

You don't need to "keep proving it".
You don't need to trade more because you're doing well.

In fact, you might need to do the opposite.

You might need to trade more defensively:

- reduce size slightly
- take fewer trades
- only take A+ setups

- tighten your routine: entry rules, stop rules, target rules
- and if you feel yourself getting too excited… step away

And here's a powerful idea:

If you've had an unusually good run, it's okay to protect it.
It's okay to finish early.
It's okay to stop trading for the day.

Because the goal is not to trade all day.

The goal is to build consistency and protect your account.

[6:20–6:55 | Close: the paradox of success]

So remember this:

Most traders scale back when they're losing.

But the professionals also know how to scale back when they're winning — because that's often when the ego shows up, discipline slips, and the big loss happens.

Be aware of it. Be honest with yourself.
And stay in control.

[Optional CTA]
If you want, comment "WINNING STREAK" and I'll share the exact rule I use to reduce risk after a strong run — without killing momentum.

---

1. **“Your Trading Won’t Improve Until You Do This (The Journal Method Pros Use)”**
2. **“Hate Trading Journals? Do This 2-Minute Version — It Will Expose Your Biggest Mistakes”**

Heygen Video Script (≈6–7 minutes): “Why You Need a Trading Journal (Even If You Hate Admin)”

[0:00–0:25 | Hook]
This is something I really recommend to my subscribers — especially anyone who enrols on my technical analysis and day trading course:

Keep a trading journal.

Now I’m going to be completely honest with you… I don’t come from a background where journaling was a thing.

When I traded on the floor in the ’90s, we weren’t exactly going to pull out a notepad and start writing down trades. I was a market maker on LIFFE — trading constantly. Dozens of trades an hour. It wasn’t practical.

So I get it if you hear “journal” and you think: *admin… boring… not for me.*

But here’s the truth: journaling is one of the fastest ways to improve your trading — because it shows you what you’re doing that you don’t even realise you’re doing.

[0:25–1:20 | Why journaling matters (and why most traders avoid it)]

When we moved from the trading floor into prop offices, I still didn’t see people walking around saying, “Are you keeping your trading journal?”

It just wasn’t part of the culture.

But for retail traders — and especially for anyone building skill — a journal is powerful because it gives you something most traders don’t have:

a written track record you can study.

And if you don't have anything to study, you can't improve systematically.
You're just relying on memory… and memory is unreliable.

As humans, we tend to remember the good trades and forget the bad ones.
But you learn the most from the losing trades.

So even if you hate admin — and I'm like that too — I still recommend you keep at least brief records.

[1:20–5:45 | What to write in a trading journal (simple structure)]

1) The basics: what trade did you take?

Start simple.

Write down the trade:
"I bought gold at this price."
Or: "I sold EUR/USD at this level."

Also include:

- date and time
- market/instrument
- timeframe you used (1H, 4H, etc.)

Keep it quick.

2) The most important question: *why* did you take it?

This is where the journal becomes a weapon.

Ask yourself:

- Why did I enter this trade?
- What was the setup?
- Why that entry level?
- Why that stop loss?
- Why that target?

Because if you can't explain why you entered, you don't have a strategy — you're gambling.

And if you *do* have a strategy, writing it down helps you prove whether you're actually following it.

3) How did the trade play out? (management notes)

This is where you catch your habits.

Write down what happened after entry:

- Did it go straight in your favour or against you?
- Did it hit Target 1?
- Did you trail your stop? Where to?
- Did you take partial profit?
- Did you exit early? Why?

These notes help you spot patterns like:

- "I always take profit too early."
- "I trail my stop too aggressively."
- "I move my stop when I'm nervous."
- "I don't follow my plan when price goes against me."

4) Market conditions: did the market suit your strategy?

This is a big one that traders miss.

Write down the environment:

- Was the market trending up?
- Trending down?

- Sideways and choppy?
- High volatility or quiet?

Then ask:
Did those conditions fit my strategy?

Because sometimes your strategy is fine — you're just applying it in the wrong conditions.

5) Risk management: what did you risk and was it consistent?

Write down:

- position size
- % risk (or £ amount)
- stop distance
- risk-to-reward ratio

And be honest: Did you risk more because you felt confident?
Did you risk more because you wanted to "make it back"?
Did you risk less because you were scared?

This is how you catch the real reason your results swing around.

6) Outcome: what was the result — and was it a "good trade"?

Record the outcome:

- win/loss
- how many pips/points
- R multiple (if you track it)
- where you exited

But here's the key:

A "good trade" is not the same as a "winning trade".

A good trade is one where you followed your rules.
A bad trade is one where you broke your rules — even if you got lucky and made money.

Your journal should teach you that difference.

[5:45–6:40 | The game-changer: track your emotional state]

Now here's something I didn't even think about until subscribers suggested it — and it's brilliant:

Write down your emotional state when you enter the trade.

For example:

Are you feeling confident?
"Great support level, I've done my homework, it fits my criteria."

Or are you feeling bored?
"I haven't traded all morning… what the hell… I'll give it a go."

Or are you feeling nervous?
"I've had three losing trades… I need this one to work… I've got to get the money back."

That one note alone can expose your biggest leaks.

Because most bad trades don't come from bad analysis — they come from the wrong emotional state.

[6:40–7:05 | Close + CTA]

So even if you don't want to write pages of notes, keep a simple journal.

Because over time you'll build a picture of:

- how your strategy performs
- how you manage trades

- and how your emotions affect your decisions

If you keep a trading journal, let me know what you include — I'm always interested.

And if you're not journaling yet but you want to start, comment below and I'll share a simple one-page template you can copy.

If you enjoyed this video, please like, share, and subscribe — and post your questions, I'll get back to you as soon as possible.

Heygen Video Script (≈6–7 minutes): "Your Entries Are Fine… But Your Timing Is Terrible"

[0:00–0:20 | Hook]
Let me say something that might annoy you — but it's true for a lot of traders:

Your entries might actually be fine.
Your analysis might be fine.
Your strategy might even be fine.

But your **timing** is terrible.

And bad timing can make a good setup look like a bad strategy.

So in this video I'm going to show you why the *same* trade idea can work beautifully at one time of day… and completely fail at another — and how to fix it with a simple timing framework.

[0:20–0:55 | The real problem: same setup, different conditions]

Most traders think a setup is a setup.

"If price hits support in a bull trend, I buy."
Simple.

But markets don’t behave the same way all day long.

Liquidity changes. Volatility changes. The type of participants changes.
And that means the quality of your entry changes — even if the chart looks identical.

So if you keep getting chopped up, stopped out by a few pips, or watching price hit your level and then do nothing for hours… it might not be your entry.

It might be when you’re taking it.

[0:55–1:45 | The 3 timing traps that ruin good entries]

Here are three timing traps I see all the time:

1) Trading the “dead” hours

There are periods where price just drifts. Spreads can be wider, moves are smaller, and the market can feel random.

In those hours, you can get lots of little fake moves that trigger you in… then go nowhere… then stop you out.

2) Trading the transition between sessions

When one major session is closing and another is opening, behaviour can change quickly.

You can get sudden spikes, stop runs, reversals, and choppy price action — even if the higher timeframe trend is still intact.

3) Trading right before major volatility events

If you’re entering just before a big scheduled event, you can get whipsawed.

Price can hit your stop and then go straight to your target without you.
That’s not “bad analysis” — that’s bad timing.

[1:45–2:40 | A simple way to think about timing: who is in the market?]

Here's a simple way to think about timing:

Ask yourself: **who is active right now?**

At different times of day, you get different participants:

- institutions
- banks
- funds
- retail traders
- algorithmic flows
- news-driven traders

And when participation changes, price behaviour changes.

That's why sometimes you'll see a clean trend move at one time of day…
and at another time it's just chop, stop hunts, and frustration.

So timing isn't some advanced concept — it's just understanding when the market is actually "alive".

[2:40–3:40 | The "timing filter" that fixes a lot of trades]

Here's the timing filter I want you to use.

Before you take any trade, ask:

1. **Is this a high-liquidity period for this market?**
2. **Is volatility likely to expand or contract right now?**
3. **Am I trading into a session open, or into a session close?**
4. **Is there scheduled news that can spike price?**
5. **Does my strategy work better in trend conditions or range conditions — and is that what we have right now?**

Because some strategies need volatility.
Some strategies need stability.
Some strategies need clean trends.
Some strategies do better in ranges.

If you don’t match the strategy to the timing, you’ll feel like the market is “against you”.

It’s not against you — you’re just trading the wrong conditions.

[3:40–4:40 | What to do in practice: build “best hours” and “no trade hours”]

Here’s what I recommend:

Create two lists for yourself:

Your “best hours”

These are the hours where:

- your setups play out cleanly
- spreads are reasonable
- you feel calm
- you’re not getting chopped up

Your “no trade hours”

These are the hours where:

- you get fake moves
- you get stopped out more
- price goes nowhere
- you feel impatient and start forcing trades

And be honest — your results will tell you the truth.

A lot of traders don’t have a strategy problem.
They have a *time-of-day discipline* problem.

[4:40–5:35 | The biggest mindset shift: missing trades is fine]

Now here's the mindset shift that makes this work:

You must be willing to miss trades.

Because once you start filtering by timing, you'll see setups outside your best hours.

And you'll feel that urge:
"It looks good… I'll just take it."

But if your timing is consistently bad, that one decision is how you end up giving profits back.

Professional trading is selective.

You're not trying to catch every move.
You're trying to catch the moves that happen in conditions that suit your strategy.

[5:35–6:25 | Quick example (generic, no specific market needed)]

Let's say you've identified a beautiful support level in an uptrend.

If you take that entry during a liquid, active period, you might get:

- a clean bounce
- follow-through
- and a smooth move to target

But if you take the same entry during a choppy period, you might get:

- a small bounce
- then a retest
- then a stop run
- then it goes without you

Same level. Same analysis. Different timing.

[6:25–6:55 | Close + CTA]**

So if you feel like you're doing the right analysis but still getting inconsistent results, don't immediately assume your strategy is broken.

Check your timing.

Because the market has seasons — and it has hours.

If you want, comment the market you trade — forex, gold, indices — and the hours you normally trade, and I'll tell you what timing filter I'd start with to reduce chop and improve follow-through.

Heygen Video Script (≈6 minutes): "The One Trade a Day Challenge (Why It Makes Traders Profitable)"

[0:00–0:20 | Hook]
If you're struggling with consistency, I want you to try something that sounds almost too simple:

One trade a day. That's it.

Not ten trades. Not "I'll take what the market gives me."
One properly planned trade — and then you stop.

This is called the **One Trade a Day Challenge**, and it's one of the fastest ways to fix overtrading, revenge trading, and emotional decision-making.

And yes — it can actually make you more profitable.

Let me explain why.

[0:20–1:05 | Why most traders lose: too many decisions]

Most traders don’t lose because they can’t spot a setup.

They lose because they make too many decisions in a day.

Every extra trade is another chance to:

- chase an entry
- move a stop
- take profit too early
- revenge trade
- trade out of boredom
- trade because you “need” to make money today

And the more decisions you make, the more your emotions get involved.

So the One Trade a Day Challenge isn’t about being lazy.

It’s about reducing the number of times you give your emotions a chance to sabotage you.

[1:05–1:45 | What the challenge is (simple rules)]

Here’s the challenge:

For the next 10 trading days, you take **one trade per day maximum**.

And you only take it if it meets your rules.

If you don’t get a clean setup — you don’t trade.

If you take your one trade and it loses — you stop.

If you take your one trade and it wins — you stop.

No “just one more”. No “I’ll win it back”. No “I’m on a roll.”

You’re training discipline.

[1:45–2:35 | Why it works: it forces selectivity]

The first reason this works is it forces you to become selective.

When you know you’ve only got one bullet, you stop wasting it on average trades.

You stop taking “maybe” setups.
You stop taking trades that don’t really fit.
You stop trading because you’re bored.

You start waiting for the cleanest opportunity — the one that genuinely matches your strategy.

And that alone improves your win rate and your risk-to-reward.

Because most profits come from a small number of high-quality trades — not from constant activity.

[2:35–3:25 | Why it works: it fixes trade management]

The second reason it works is it improves your trade management.

When you’re taking lots of trades, you tend to rush:

- rushed entries
- rushed stops
- rushed exits

With one trade a day, you have time to do it properly:

- plan the entry
- calculate position size
- place the stop loss logically

- set targets
- decide how you'll manage the trade if it goes in your favour

You're no longer "reacting" to the market.
You're executing a plan.

And that's professional trading.

[3:25–4:10 | Why it works: it kills revenge trading]

Third reason: it kills revenge trading.

Revenge trading happens when you take a loss and you feel: "I need to make it back today."

So you jump into another trade quickly, usually lower quality, usually bigger emotion, usually worse execution.

One trade a day removes that option.

It forces you to accept the loss as part of the business.

And that's how you protect your account.

[4:10–4:55 | Why it builds a clean dataset]

Fourth reason: it gives you a clean dataset.

If you take one trade a day for 10 days, that's 10 trades.

And those trades are usually your best setups — not random noise.

Now you can review them properly:

- Did I follow my rules?
- Was my stop in the right place?

- Did I take profit too early?
- Did I enter too early?
- Did I trade at the right time of day?

This is how you actually improve.

Most traders never improve because their trading is too messy to analyse.

[4:55–5:35 | The mindset shift: you're paid to wait]

Now here's the mindset shift you need:

You are not paid to trade.
You are paid to wait… and then execute one good decision.

If you think trading is about constant action, you'll always overtrade.

But if you treat it like a sniper — one clean shot — you'll start to feel calm and in control.

And that's when consistency starts.

[5:35–6:10 | How to start (practical steps)]

Here's how to start today:

1. Decide your "A+ setup" — the one trade you're allowed to take
2. Decide your max risk per trade (keep it small)
3. Set your entry, stop, and target before you enter
4. Take the trade — then stop for the day
5. Journal it in 3 lines: setup, execution, lesson

Do that for 10 days and you'll be amazed what it fixes.

[6:10–6:25 | Close + CTA]**

If you want, comment **“ONE TRADE”** and I’ll share a simple checklist you can use to qualify whether a setup is good enough to be your one trade of the day.

Because the goal isn’t to trade more.

The goal is to trade better.

Heygen Video Script (≈6–7 minutes): “How to Handle News Days (CPI, NFP, Rate Decisions) Without Getting Wrecked”

[0:00–0:25 | Hook]
If you day trade forex, gold, indices — whatever it is — you’re going to face news days like **CPI**, **NFP**, and **rate decisions**.

And these are the days where good traders can get paid… but most traders get wrecked.

Not because their analysis is bad — but because they don’t understand what news does to **volatility**, **spreads**, and **execution**.

So in this video I’m going to give you a simple, practical framework for news days:
when to stand aside, when to reduce size, when to widen stops — and why slippage can make your stop loss meaningless if you don’t respect it.

[0:25–1:10 | What changes on news days]

On a normal day, price action is relatively readable.

On a major news day, the market can do things that feel completely irrational:

- sudden spikes up and down

- stop runs through obvious levels
- fake breakouts
- instant reversals
- and moves that happen so fast you can't react manually

And that's the first lesson:

News days punish hesitation and punish improvisation.

If you don't have a plan *before* the release, you'll make emotional decisions during the release — and that's where accounts get damaged.

[1:10–2:05 | The 3 biggest dangers: spreads, slippage, and whipsaw]

There are three things you must understand on news days:

1) Spreads widen

The spread is the cost of entry and exit. On news, spreads can widen dramatically.

That means:

- you can get filled worse than you expect
- your stop can be hit even if price "barely" touched the level
- and your risk-to-reward gets destroyed without you realising

2) Slippage happens

Slippage is when your stop loss doesn't fill at your stop price — it fills at the next available price.

So you might risk 10 pips… but you lose 20 or 30.

That's why trading news without adjusting risk is dangerous.

3) Whipsaw is normal

Price can spike one way, trigger everyone in, then reverse violently.

So if you trade news like a normal technical setup, you'll often get chopped up.

[2:05–2:55 | Rule 1: If you don't have a news plan, stand aside]

Here's the first rule I teach:

If you don't have a specific plan for news, don't trade it.

Standing aside is a position.

Most traders feel they *have* to trade because it's "a big day".

But the market doesn't pay you for excitement.
It pays you for good decisions.

So if you're not experienced with news volatility, the best move is often to wait until after the release and trade the reaction when price action becomes readable again.

[2:55–3:55 | Rule 2: If you trade news, reduce size first]

If you do decide to trade on a news day, the first adjustment is simple:

Reduce size.

Because your risk is not just your stop distance — your risk is also:

- spread widening
- slippage
- and speed of movement

So even if your stop is the same number of pips, the real-world loss can be bigger.

Reducing size keeps you calm and keeps you in control.

If you trade the same size you trade on normal days, you're basically saying: "I'm happy to risk a random amount today."

And that's not professional trading.

[3:55–4:55 | Rule 3: Widen stops only if you reduce size (and only with a reason)]

Now, some traders make the mistake of widening stops without thinking.

Wider stop + same size = bigger loss.
That's how you blow a hole in the account.

So here's the rule:

If you widen the stop because volatility is higher, you must reduce position size so the £ risk stays the same.

And the stop must still be logical — based on the chart and market structure — not based on what you "hope" can hold.

A stop loss is there to tell you the trade is wrong.
On news days, you need to give price more breathing space — but you still need a point where you admit you're wrong.

[4:55–5:40 | Rule 4: Know when to stand aside (my simple checklist)]

Here's a simple checklist for when you should stand aside completely:

- You're already emotional or tired
- You've had a losing streak and you're trying to "make it back"
- You don't know the exact release time
- You haven't checked the calendar and you're guessing
- Your strategy relies on clean technical levels and the market is likely to spike through them
- You can't accept slippage as part of the day

If any of those are true, standing aside is the professional decision.

[5:40–6:25 | Rule 5: Trade the aftermath, not the explosion]

This is what I prefer for most traders:

Don’t trade the release. Trade the aftermath.

Let the first spike happen. Let the market show its hand.

Then look for:

- a clear trend direction
- a pullback to a level
- and a structured entry with a logical stop and target

Because after the initial chaos, the market often becomes more technical again.

And that’s where disciplined traders can find low-risk opportunities — without gambling on the first 10 seconds.

[6:25–6:55 | Close + CTA]**

So remember this on news days:

- spreads widen
- slippage happens
- whipsaw is normal
- and if you don’t have a plan, don’t trade

Reduce size, widen stops only with logic, and consider trading the reaction after the release instead of the release itself.

If you want, comment the market you trade — forex, gold, indices — and I’ll tell you the exact “news-day rule” I’d use for your situation.
